5. How memory is managed in Python?

Ans: Python memory is managed by Python private heap space. All Python objects and data structures are created in this memory. The allocation of Python heap space for Python objects is done by Python memory manager. The compiler of Python also have an inbuilt garbage collector, which recycle all the unused memory and frees the memory and makes it available to the heap space.

6. What are the tools that help to find bugs or perform static analysis?

Ans: PyChecker is a static analysis tool that detects the bugs in Python source code and warns about them.

7. What are Python decorators?

Ans: A Python decorator is a specific change that we make in Python syntax to alter functions or classes.

8. What is the difference between list and tuple?

Ans: The difference between list and tuple is that list is mutable while tuple is not. Tuple cannot be modified after creation.

9. How are arguments passed by value or by reference?

Ans: Everything in Python is an object and all variables hold references to the objects. The references are passed by value.

10. What is Dict and List comprehensions are?

Ans: They are syntax constructions to ease the creation of a Dictionary or List based on existing lists.

11. What are the built-in type does python provides?

Ans: There are mutable and Immutable types of Python's built-in types. Mutable built-in types: List, Sets, Dictionaries. Immutable built-in types: Strings, Tuples, Numbers.

12. What is namespace in Python?

Ans: In Python, every name introduced has a place where it lives and can be hooked for. This is called a namespace.

13. What is lambda in Python?

Ans: It is a single expression anonymous function often used as an in-line function.

14. Why lambda forms in python does not have statements?

Ans: A lambda form in python does not have statements as it is used to make new function objects.

15. What is pass in Python?

Ans: Pass means, no-operation Python statement, or in other words it is a placeholder in compilation.

16. In Python what are iterators?

Ans: In Python, iterators are used to iterate a group of elements, containers like list.

17. What is unit test in Python?

Ans: A unit testing framework in Python is known as unittest. It supports sharing of setups, assertions, and tear-down.

18. In Python what is slicing?

Ans: A mechanism to select a range of items from sequence types like list, tuple, strings etc.

19. What are generators in Python?

Ans: The way of implementing iterators are known as generators. It is a normal function except

20. What is docstring in Python?

Ans: A Python documentation string is known as docstring, it is a way of documenting Python fun

21. How can you copy an object in Python?

Ans: To copy an object in Python, you can try `copy.copy()` or `copy.deepcopy()` for the general c

22. What is negative index in Python?

Ans: Python sequences can be index in positive and negative numbers. For positive index, 0 is t

23. How you can convert a number to a string?

Ans: In order to convert a number into a string, use the inbuilt function `str()`. If you want a

24. What is the difference between Xrange and range?

Ans: Xrange returns the xrange object while range returns the list, and uses the same memory ar

25. What is module and package in Python?

Ans: In Python, module is the way to structure program. Each Python program file is a module, v

The folder of Python program is a package of modules. A package can have modules or subfolders

26. Mention what are the rules for local and global variables in Python?

Ans: Local variables: If a variable is assigned a new value anywhere within the function's body

Global variables: Those variables that are only referenced inside a function are implicitly glo

27. How can you share global variables across modules?

Ans: To share global variables across modules within a single program, create a special module

28. Explain how can you make a Python Script executable on Unix?To make a Python Script execut

Ans: Script file's mode must be executable and

the first line must begin with # ( #!/usr/local/bin/python)

29. Explain how to delete a file in Python?

Ans: By using a command `os.remove (filename)` or `os.unlink(filename)`

30. Explain how can you generate random numbers in Python?

Ans: To generate random numbers in Python, you need to import command as `import random`  
`random.random()`

This returns a random floating point number in the range `[0,1)`

31. Explain how can you access a module written in Python from C?

Ans: You can access a module written in Python from C by following method, `Module = PyImport_`

32. Mention the use of `//` operator in Python?

Ans: It is a Floor Divisionoperator , which is used for dividing two operands with the result a

241  
242  
243 33. Mention five benefits of using Python?

244 Ans: Python comprises of a huge standard library for most Internet platforms like Email, HTML,  
245 Python does not require explicit memory management as the interpreter itself allocates the memo  
246 Provide easy readability due to use of square brackets Easy-to-learn for beginners  
247 Having the built-in data types saves programming time and effort from declaring variables  
248

349  
350 41. What type of a language is python? Interpreted or Compiled?

351 Ans: Beginner's Answer:

352 Python is an interpreted, interactive, objectoriented programming language.

353 Expert Answer:

354 Python is an interpreted language, as opposed to a compiled one, though the  
355 distinction can be blurry because of the presence of the bytecode compiler. This means  
356 that source files can be run directly without explicitly creating an executable which is  
357 then run.

358  
359  
360  
361  
362  
363  
364  
365 42. What do you mean by python being an "interpreted language"? (Continues from previous question)

366 Ans: An interpreted language is a programming language for which most of its  
367 implementations execute instructions directly, without previously compiling a program  
368 into machine language instructions. In context of Python, it means that Python program  
369 runs directly from the source code.

370  
371  
372  
373  
374  
375  
376 43. What is python's standard way of identifying a block of code?

377 Ans: Indentation.

378  
379  
380  
381  
382  
383  
384  
385 44. Please provide an example implementation of a function called "my\_func" that returns the square of a number.

386 Ans:

```
387 def my_func(x):  
388     return x**2
```

389  
390  
391  
392  
393  
394  
395  
396 45. Is python statically typed or dynamically typed?

Ans: Dynamic.

In a statically typed language, the type of variables must be known (and usually declared) at the point at which it is used. Attempting to use it will be an error. In a dynamically typed language, objects still have a type, but it is determined at runtime. You are free to bind names (variables) to different objects with a different type. So long as you only perform operations valid for the type the interpreter doesn't care what type they actually are.

46. Is python strongly typed or weakly typed language?

Ans: Strong.

In a weakly typed language a compiler / interpreter will sometimes change the type of a variable. For example, in some languages (like JavaScript) you can add strings to numbers 'x' + 3 becomes 'x3'. This can be a problem because if you have made a mistake in your program, instead of raising an exception execution will continue but your variables now have wrong and unexpected values. In a strongly typed language (like Python) you can't perform operations inappropriate to the type of the object attempting to add numbers to strings will fail. Problems like these are easier to diagnose because the exception is raised at the point where the error occurs rather than at some other, potentially far removed, place.

47. Create a unicode string in python with the string "This is a test string"?

Ans: some\_variable=u'Thisisteststring'

Or

some\_variable=u"Thisisteststring"

48. What is the python syntax for switch case statements?

Ans: Python doesn't support switchcase statements. You can use ifelse statements for this purpose.

```
449
450
451 49. What is a lambda statement? Provide an example.
452 Ans: A lambda statement is used to create new function objects and then return them at
453 runtime. Example:
454 my_func=lambda x:x**2
455 creates a function called my_func that returns the square of the argument
456 passed.
457
458
459
460
461
462
463
464
465 50.What are the rules for local and global variables in Python?
466 Ans: If a variable is defined outside function then it is implicitly global. If variable is
467 assigned new value inside the function means it is local. If we want to make it global we
468
469 need to explicitly define it as global. Variable referenced inside the function are implicit
470 global
471
472
473
474
475
476
477
478
479 51.What is the output of the following program?
480 Ans:
481
482 #!/usr/bin/python
483 def fun1(a):
484     print 'a:',a
485     a=33;
486     print 'locala:',a
487     a=100
488     fun1(a)
489     print 'aoutsidefun1:',a
490 Ans. Output:
491 a:100
492 locala:33
493 aoutsidefun1:100
494
495
496
497
498
499
500
```

501  
502  
503  
504 52.What is the output of the following program?

505 Ans:

```
506  
507 #!/usr/bin/python  
508 def fun2():  
509     global b  
510     print 'b:', b  
511     b=33  
512     print 'global b:', b  
513     b=100  
514     fun2()  
515     print 'b outside fun2', b  
516 Ans. Output:  
517 b:100  
518 global b:33  
519 b outside fun2:33
```

520

521

522

523

524

525

526 53. What is the output of the following program?

527 Ans:

528

```
529 #!/usr/bin/python
```

530

```
531 def foo(x,y):  
532     global a  
533     a=42  
534     x,y=y,x  
535     b=33  
536     b=17  
537     c=100  
538     print(a,b,x,y)  
539     a,b,x,y=1,15,3,4  
540     foo(17,4)  
541     print(a,b,x,y)
```

542

543 Ans.Output:

544 4217417

545 421534

546

547 54.What is the output of the following program?

548 Ans:

549

```
550 #!/usr/bin/python
```

```
551 def foo(x=[]):
```

```
552     x.append(1)
```

```
553 returnx
554 foo()
555 foo()
556
557 Output:
558 [1]
559 [1,1]
560
561 55. What is the purpose of #!/usr/bin/pythonon the first line in the above
562 code? Is there any advantage?
563 Ans: By specifying #!/usr/bin/pythonyou specify exactly which interpreter will be
564 used to run the script on a particular system. This is the hardcoded path to the python
565 interpreter for that particular system. The advantage of this line is that you can use a
566 specific python version to run your code.
567
568 56.What is the output of the following program?
569 Ans:
570
571 list=['a','b','c','d','e']
572 printlist[10]
573 Ans. Output:
574 IndexError.Or Error.
575
576 57.What is the output of the following program?
577 Ans:
578
579 list=['a','b','c','d','e']
580 printlist[10:]
581 Ans. Output:
582 []
583 Theabovecodewilloutput[],andwillnotresultinanIndexError.
584 As one would expect, attempting to access a member of a list using an index that
585 exceeds the number of members results in an IndexError.
586
587 58. What does this list comprehension do:
588 Ans:
589
590 [x**2forxinrange(10)ifx%2==0]
591 Ans. Creates the following list:
592 [0,4,16,36,64]
593
594 59. Do sets, dictionaries and tuples also support comprehensions?
595 Ans: Sets and dictionaries support it. However tuples are immutable and have
596 generators but not comprehensions.
597 Set Comprehension:
598 r={xforxinrange(2,101)
599 ifnotany(x%y==0foryinrange(2,x))}
600 Dictionary Comprehension:
601 {i:jfori,jin{1:'a',2:'b'}.items()}
602 since
603 {1:'a',2:'b'}.items()returnsalistof2-Tuple.iisthefirstelement
604 oftuplejisthesecond.
```

```
605
606 60.What are some mutable and immutable datatypes/datastructures in
607 python?
608 Ans:
609 Mutable Types Immutable Types
610
611 Dictionary number
612 List boolean
613 string
614 tuple
615
616 61.What are generators in Python?
617 Ans: Generators are functions that return an iterable collection of items, one at a time, in a
618 Let's try and build a generator for fibonacci numbers -
619
620 ## generate fibonacci numbers upto n
621 def fib(n):
622     p, q = 0, 1
623     while(p < n):
624         yield p
625         p, q = q, p + q
626
627 x = fib(10)    # create generator object
628
629 ## iterating using __next__(), for Python2, use next()
630 x.__next__()   # output => 0
631 x.__next__()   # output => 1
632 x.__next__()   # output => 1
633 x.__next__()   # output => 2
634 x.__next__()   # output => 3
635 x.__next__()   # output => 5
636 x.__next__()   # output => 8
637 x.__next__()   # error
638
639 ## iterating using loop
640 for i in fib(10):
641     print(i)    # output => 0 1 1 2 3 5 8
642
643
644
645
646 62.What can you use Python generator functions for?
647 Ans: One of the reasons to use generator is to make the solution clearer for some kind
648 of solutions.
649 The other is to treat results one at a time, avoiding building huge lists of results that you
650 would process separated anyway.
651
652 63.When is not a good time to use python generators?
653 Ans: Use list instead of generator when:
654 1 You need to access the data multiple times (i.e. cache the results instead of
655 recomputing them)
656 2 You need random access (or any access other than forward sequential order):
```

657 3 You need to join strings (which requires two passes over the data)  
658 4 You are using PyPy which sometimes can't optimize generator code as much  
659 as it can with normal function calls and list manipulations.  
660  
661 64.What's your preferred text editor?  
662 Ans: Emacs. Any alternate answer leads to instant disqualification of the applicant  
663  
664 65.When should you use generator expressions vs. list comprehensions in Python and vice-versa?  
665 Ans: Iterating over the generator expression or the list comprehension will do the same  
666 thing. However, the list comp will create the entire list in memory first while the  
667 generator expression will create the items on the fly, so you are able to use it for very  
668 large (and also infinite!) sequences.  
669  
670 66. What is a negative index in Python?  
671 Ans: Python arrays and list items can be accessed with positive or negative numbers. A  
672 negative Index accesses the elements from the end of the list counting backwards.  
673 Example:  
674 a=[123]  
675 printa[-3]  
676 printa[-2]  
677 Outputs:  
678 1  
679 2  
680  
681 67. What is the difference between range and xrange functions?  
682 Ans: Range returns a list while xrange returns an xrange object which take the  
683 same memory no matter of the range size. In the first case you have all items already  
684 generated (this can take a lot of time and memory). In Python 3 however, range is  
685 implemented with xrange and you have to explicitly call the list function if you want to  
686 convert it to a list.  
687  
688  
689  
690 68. How can I find methods or attributes of an object in Python?  
691 Ans: Builtin dir() function of Python ,on an instance shows the instance variables as  
692 well as the methods and class attributes defined by the instance's class and all its base  
693 classes alphabetically. So by any object as argument to dir() we can find all the  
694 methods & attributes of the object's class  
695  
696 69. What is the statement that can be used in Python if a statement is required syntactically b  
697 Ans:  
698 pass  
699  
700 70. Do you know what is the difference between lists and tuples? Can you give me an example for  
701 Ans:  
702 First list are mutable while tuples are not, and second tuples can be hashed e.g.  
703 to be used as keys for dictionaries. As an example of their usage, tuples are used when  
704 the order of the elements in the sequence matters e.g. a geographic coordinates, "list"  
705 of points in a path or route, or set of actions that should be executed in specific order.  
706 Don't forget that you can use them a dictionary keys. For everything else use lists  
707  
708 71. What is the function of "self"?

```
709 Ans:
710 "Self" is a variable that represents the instance of the object to itself. In most of
711 the object oriented programming languages, this is passed to the methods as a hidden
712 parameter that is defined by an object. But, in python it is passed explicitly. It refers to
713 separate instance of the variable for individual objects. The variables are referred as
714 "self.xxx".
715
716 72. How is memory managed in Python?
717 Ans:
718 Memory management in Python involves a private heap containing all
719 Python objects and data structures. Interpreter takes care of Python heap and
720 the programmer has no access to it. The allocation of heap space for Python
721 objects is done by Python memory manager. The core API of Python provides
722 some tools for the programmer to code reliable and more robust program. Python
723 also has a builtin garbage collector which recycles all the unused memory.
724 The gc module defines functions to enable /disable garbage collector:
725 gc.enable() Enables automatic garbage collection.
726 gc.disable()-Disables automatic garbage collection
727
728 73. What is __init__.py?
729 Ans:
730 It is used to import a module in a directory, which is called package import.
731
732 74. Print contents of a file ensuring proper error handling?
733 Ans:
734 try:
735     withopen('filename','r')asf:
736         printf.read()
737 exceptIOError:
738     print"Nosuchfileexists"
739
740 75 How do we share global variables across modules in Python?
741 Ans:
742 We can create a config file and store the entire global variable to be
743 shared across modules in it. By simply importing config, the entire global variable
744 defined will be available for use in other modules.
745 For example I want a, b & c to share between modules.
746 config.py :
747 a=0
748 b=0
749 c=0
750 module1.py:
751 importconfig
752 config.a=1
753 config.b=2
754 config.c=3
755 print"a,b&resp.are:",config.a,config.b,config.c
756
757 output of module1.py will be
758 123
759
760 76. Does Python support Multithreading?
```

```
761 Ans: Yes
762 Medium
763
764 77. How do I get a list of all files (and directories) in a given directory in Python?
765 Ans: Following is one possible solution there can be other similar ones:
766 import os
767 for dirname,dirnames,filenames in os.walk('.'):
768     #printpathtoallsubdirectoriesfirst.
769     forsubdirnameindirnames:
770         printos.path.join(dirname,subdirname)
771     #printpathtoallfilenames.
772     forfilenameinfilenames:
773         printos.path.join(dirname,filename)
774     #Advancedusage:
775     #editingthe'dirnames'listwillstopos.walk()fromrecurring
776     intothere.
777     if'.git'indirnames:
778         #don'tgointoany.gitdirectories.
779         dirnames.remove('.git')
780
781 78. How to append to a string in Python?
782 Ans: The easiest way is to use the += operator. If the string is a list of character, join()
783 function can also be used.
784
785 79. How to convert a string to lowercase in Python?
786 Ans: use lower() function.
787 Example:
788 s='MYSTRING'
789 prints.lower()
790
791 80. How to convert a string to lowercase in Python?
792 Ans: Similar to the above question. use upper() function instead.
793
794 81. How to check if string A is substring of string B?
795 Ans: The easiest way is to use the in operator.
796 >>> 'abc' in 'abcdefg'
797 True
798
799 82. Find all occurrences of a substring in Python
800 Ans: There is no simple builtin string function that does what you're looking for, but
801 you could use the more powerful regular expressions:
802 >>>[m.start()forminre.finditer('test','testtesttesttest')]
803 [0,5,10,15]//thesearestartingindicesforthestring
804
805 83. What is GIL? What does it do?Talk to me about the GIL. How does it impact concurrency in Py
806 Ans: Python's GIL is intended to serialize access to interpreter internals from different
807 threads. On multicore systems, it means that multiple threads can't effectively make
808 use of multiple cores. (If the GIL didn't lead to this problem, most people wouldn't care
809 about the GIL it's only being raised as an issue because of the increasing prevalence
810 of multicore systems.)
811 Note that Python's GIL is only really an issue for CPython, the reference
812 implementation. Jython and IronPython don't have a GIL. As a Python developer, you
```

```
813 don't generally come across the GIL unless you're writing a C extension. C extension
814 writers need to release the GIL when their extensions do blocking I/O, so that other
815 threads in the Python process get a chance to run.
816
817 84. Print the index of a specific item in a list?
818 Ans: use the index() function
819 >>>["foo","bar","baz"].index('bar')
820 1
821 .
822
823 85.How do you iterate over a list and pull element indices at the same time?
824 Ans: You are looking for the enumerate function. It takes each element in a sequence
825 (like a list) and sticks it's location right before it. For example:
826
827 >>>my_list=['a','b','c']
828 >>>list(enumerate(my_list))
829 [(0,'a'),(1,'b'),(2,'c')]
830 Note that enumerate() returns an object to be iterated over, so wrapping it in list() just
831 helps us see what enumerate() produces.
832 An example that directly answers the question is given below
833 my_list=['a','b','c']
834 for i, char in enumerate(my_list):
835     print i, char
836 The output is:
837 0a
838 1b
839 2c
840
841 86. How does Python's list.sort work at a high level? Is it stable? What's the runtime?
842 Ans: In early python versions, the sort function implemented a modified version of
843 quicksort. However, it was deemed unstable and as of 2.3 they switched to using an
844 adaptive mergesort algorithm.
845
846 87. What does the list comprehension do:
847 Ans:
848 my_list=[(x,y,z) for x in range(1,30) for y in range(x,30) for z in
849 range(y,30) if x**2+y**2==z**2]
850 It creates a list of tuples called my_list, where the first 2 elements are the
851 perpendicular sides of right angle triangle and the third value 'z' is the hypotenuse.
852 [(3,4,5),(5,12,13),(6,8,10),(7,24,25),(8,15,17),(9,12,15),
853 (10,24,26),(12,16,20),(15,20,25),(20,21,29)]
854
855 88. How can we pass optional or keyword parameters from one function to another in Python?
856 Ans:
857 Gather the arguments using the * and ** specifiers in the function's parameter list. This
858 gives us positional arguments as a tuple and the keyword arguments as a dictionary.
859 Then we can pass these arguments while calling another function by using * and **:
860 def fun1(a,*tup,**keywordArg):
861     ...
862     keywordArg['width']='23.3c'
863     ...
864     Fun2(a,*tup,**keywordArg)
```

```
865
866
867
868 89. Python How do you make a higher order function in Python?
869 Ans:
870 A higherorder function accepts one or more functions as input and returns a new
871 function. Sometimes it is required to use function as data To make high order function ,
872 we need to import functools module The functools.partial() function is used often for
873 high order function.
874
875 90. What is map?
876 Ans:
877 The syntax of map is:
878 map(aFunction,aSequence)
879 The first argument is a function to be executed for all the elements of the iterable given
880 as the second argument. If the function given takes in more than 1 arguments, then
881 many iterables are given.
882
883 91. Tell me a very simple solution to print every other element of this list?
884 Ans:
885
886 L=[0,10,20,30,40,50,60,70,80,90]
887 L[::2]
888
889 92. Are Tuples immutable?
890 Ans: Yes.
891
892 93. Why is not all memory freed when python exits?
893 Ans: Objects referenced from the global namespaces of Python modules are not
894 always deallocated when Python exits. This may happen if there are circular
895 references. There are also certain bits of memory that are allocated by the C library that
896 are impossible to free (e.g. a tool like the one Purify will complain about these). Python
897 is, however, aggressive about cleaning up memory on exit and does try to destroy every
898 single object. If you want to force Python to delete certain things on deallocation, you
899 can use the at exit module to register one or more exit functions to handle those
900 deletions.
901
902 94. What is Java implementation of Python popularly know?
903 Ans: Jython.
904
905 95. What is used to create unicode strings in Python?
906 Ans:
907 Add u before the string.
908 u 'mystring'
909
910 96. What is a docstring?
911 Ans:
912 docstring is the documentation string for a function. It can be accessed by
913 function_name.__doc__
914
915 97. Given the list below remove the repetition of an element.
916 Ans:
```

```
917 words=['one','one','two','three','three','two']
918 A bad solution would be to iterate over the list and checking for copies somehow and
919 then remove them!
920
921 A very good solution would be to use the set type. In a Python set, duplicates are not
922 allowed.
923 So, list(set(words)) would remove the duplicates.
924
925 98. Print the length of each line in the file 'file.txt' not including any
926 whitespaces at the end of the lines?
927 Ans:
928 withopen("filename.txt","r")asf1:
929     printlen(f1.readline().rstrip())
930 rstrip() is an inbuilt function which strips the string from the right end of spaces or tabs
931 (whitespace characters).
932
933 99. What is wrong with the code?
934 Ans:
935
936 func([1,2,3])#explicitlypassinginalist
937 func() #usingadefaultemptylist
938 deffunc(n=[]):
939     #dosomethingwithn
940     printn
941
942 This would result in a NameError. The variable n is local to function func and
943 can't be accessed outside. So, printing it won't be possible.
944
945 100. What does the below mean?
946 Ans:
947
948 s = a + '[' + b + ':' + c + ']'
949
950 seems like a string is being concatenated. Nothing much can be said without
951 knowing types of variables a, b, c. Also, if all of the a, b, c are not of type string,
952 TypeError would be raised. This is because of the string constants ('[', ']') used in the
953 statement.
954 101. What are Python decorators?
955 Ans:
956 A Python decorator is a specific change that we make in Python syntax to alter
957 functions easily.
958
959 102. What is namespace in Python?
960 Ans:
961 In Python, every name introduced has a place where it lives and can be hooked
962 for. This is known as namespace. It is like a box where a variable name is mapped to
963 the object placed. Whenever the variable is searched out, this box will be searched, to
964 get corresponding object.
965
966 103. Explain the role of repr function.
967 Ans:
968 Python can convert any value to a string by making use of two functions repr() or
```

```
969 str(). The str() function returns representations of values which are humanreadable,
970 while repr() generates representations which can be read by the interpreter. repr()
971 returns a machinereadable representation of values, suitable for an exec command.
972 Following code sniipets shows working of repr() & str() :
973 deffun():
974     y=2333.3
975     x=str(y)
976     z=repr(y)
977     print"y:",y
978     print"str(y):",x
979     print"repr(y):",z
980 fun()
981 -----
982 output
983 y:2333.3
984 str(y):2333.3
985 repr(y):2333.30000000000002
986
987 104. What is LIST comprehensions features of Python used for?
988 Ans:
989 LIST comprehensions features were introduced in Python version 2.0, it creates
990 a new list based on existing list. It maps a list into another list by applying a function to
991
992 each of the elements of the existing list. List comprehensions creates lists without using
993 map() , filter() or lambda form.
994
995 105. Explain how to copy an object in Python.?
996 Ans:
997 There are two ways in which objects can be copied in python. Shallow copy &
998 Deep copy. Shallow copies duplicate as minute as possible whereas Deep copies
999 duplicate everything. If a is object to be copied then ...
1000 copy.copy(a) returns a shallow copy of a.
1001 copy.deepcopy(a) returns a deep copy of a.
1002
1003 106. Describe how to send mail from a Python script?
1004 Ans:
1005 The smtplib module defines an SMTP client session object that can be used to
1006 send mail to any Internet machine.
1007 A sample email is demonstrated below.
1008 import smtplib
1009 SERVER = smtplib.SMTP('smtp.server.domain')
1010 FROM = sender@mail.com
1011 TO = ["user@mail.com"] # must be a list
1012 SUBJECT = "Hello!"
1013 TEXT = "This message was sent with Python's smtplib."
1014 # Main message
1015 message = """
1016 From: Lincoln < sender@mail.com >
1017 To: CarreerRide user@mail.com
1018 Subject: SMTP email msg
1019 This is a test email. Acknowledge the email by responding.
1020 """ % (FROM, ", ".join(TO), SUBJECT, TEXT)
```

```
1021 server = smtplib.SMTP(SERVER)
1022 server.sendmail(FROM, TO, message)
1023 server.quit()
1024
1025 107. Which of the languages does Python resemble in its class syntax?
1026 Ans: c++.
1027
1028 108. Python How to create a multidimensional list?
1029 Ans: There are two ways in which Multidimensional list can be created:
1030 By direct initializing the list as shown below to create myList below.
1031 >>>myList=[[227,122,223],[222,321,192],[21,122,444]]
1032 >>>printmyList[0]
1033 >>>printmyList[1][2]
1034
1035 _____
1035 Output
1036 [227, 122, 223]
1037 192
1038 The second approach is to create a list of the desired length first and then fill in each
1039 element with a newly created lists demonstrated below :
1040 >>>list=[0]*3
1041 >>>foriinrange(3):
1042 >>>list[i]=[0]*2
1043 >>>foriinrange(3):
1044 >>>forj inrange(2):
1045 >>>list[i][j]=i+j
1046 >>>printlist
1047
1048 _____
1048 Output
1049 [[0,1],[1,2],[2,3]]
1050
1051 109. Explain the disadvantages of python
1052 Ans: Disadvantages of Python are: Python isn't the best for memory intensive tasks.
1053 Python is interpreted language & is slow compared to C/C++ or Java.
1054
1055 110. Explain how to make Forms in python.
1056 Ans. As python is scripting language forms processing is done by Python. We need to
1057 import cgi module to access form fields using FieldStorage class.
1058 Every instance of class FieldStorage (for 'form') has the following attributes:
1059 form.name: The name of the field, if specified.
1060
1061 form.filename: If an FTP transaction, the clientside filename.
1062 form.value: The value of the field as a string.
1063 form.file: file object from which data can be read.
1064 form.type: The content type, if applicable.
1065 form.type_options: The options of the 'contenttype' line of the HTTP request, returned
1066 as a dictionary.
1067 form.disposition: The field 'contentdisposition'; None if unspecified.
1068 form.disposition_options: The options for 'contentdisposition'.
1069 form.headers: All of the HTTP headers returned as a dictionary.
1070 A code snippet of form handling in python:
1071 importcgi
1072 form=cgi.FieldStorage()
```

```
1073 ifnot(form.has_key("name")andform.has_key("age")):
1074     print"<H1>Name&AgenotEntered</H1>"
1075     print"FilltheName&Ageaccurately."
1076     return
1077     print"<p>name:",form["name"].value
1078     print"<p>Age:",form["age"].value
1079
1080 111. Explain how python is interpreted.
1081 Ans: Python program runs directly from the source code. Each type Python programs
1082 are executed code is required. Python converts source code written by the programmer
1083 into intermediate language which is again translated it into the native language
1084 machine language that is executed. So Python is an Interpreted language.
1085
1086 112. Explain how to overload constructors (or methods) in Python.?
1087 Ans. __init__ () is a first
1088
1089 113.What is the difference between List & Tuple in Python.?
1090 LIST vs TUPLES
1091 LIST    TUPLES
1092 Lists are mutable i.e they can be edited.      Tuples are immutable (tuples are lists which ca
1093 Lists are slower than tuples.    Tuples are faster than list.
1094 Syntax: list_1 = [10, 'Chelsea', 20]    Syntax: tup_1 = (10, 'Chelsea' , 20)
1095
1096
1097 114.What are the key features of Python?
1098 Ans:
1099
1100 Python is an interpreted language. That means that, unlike languages like C and its variants, P
1101 Python is dynamically typed, this means that you don't need to state the types of variables whe
1102 Python is well suited to object orientated programming in that it allows the definition of clas
1103 In Python, functions are first-class objects. This means that they can be assigned to variables
1104 Writing Python code is quick but running it is often slower than compiled languages. Fortunatel
1105 Python finds use in many spheres - web applications, automation, scientific modeling, big data
1106
1107
1108 115.How is Python an interpreted language?
1109 Ans: An interpreted language is any programming language which is not in machine level code bet
1110
1111 116.How is memory managed in Python?
1112 Ans:
1113
1114 Memory management in python is managed by Python private heap space. All Python objects and dat
1115 The allocation of heap space for Python objects is done by Python's memory manager. The core AP
1116 Python also has an inbuilt garbage collector, which recycles all the unused memory and so that
1117
1118
1119 117.What is PYTHONPATH?
1120 Ans:It is an environment variable which is used when a module is imported. Whenever a module is
1121
1122 118. What are python modules? Name some commonly used built-in modules in Python?
1123 Ans:Python modules are files containing Python code. This code can either be functions classes
1124
```

```
1125 Some of the commonly used built-in modules are:
1126
1127 os
1128 sys
1129 math
1130 random
1131 data time
1132 JSON
1133 119.What are local variables and global variables in Python?
1134 Ans:
1135
1136 Global Variables:
1137
1138 Variables declared outside a function or in global space are called global variables. These var
1139
1140 Local Variables:
1141
1142 Any variable declared inside a function is known as a local variable. This variable is present
1143
1144 Example:
1145
1146 1
1147 2
1148 3
1149 4
1150 5
1151 6
1152 a=2
1153 def add():
1154     b=3
1155     c=a+b
1156     print(c)
1157     add()
1158 Output: 5
1159
1160 When you try to access the local variable outside the function add(), it will throw an error.
1161
1162 120. Is python case sensitive?
1163 Ans:Yes. Python is a case sensitive language.
1164
1165 121.What is type conversion in Python?
1166 Ans:Type conversion refers to the conversion of one data type iinto another.
1167
1168 int() - converts any data type into integer type
1169
1170 float() - converts any data type into float type
1171
1172 ord() - converts characters into integer
1173
1174 hex() - converts integers to hexadecimal
1175
1176 oct() - converts integer to octal
```

```
1177
1178 tuple() - This function is used to convert to a tuple.
1179
1180 set() - This function returns the type after converting to set.
1181
1182 list() - This function is used to convert any data type to a list type.
1183
1184 dict() - This function is used to convert a tuple of order (key,value) into a dictionary.
1185
1186 str() - Used to convert integer into a string.
1187
1188 complex(real,imag) - This function converts real numbers to complex(real,imag) number.
1189
1190
1191
1192 122. How to install Python on Windows and set path variable?
1193 Ans:To install Python on Windows, follow the below steps:
1194
1195 Install python from this link: https://www.python.org/downloads/
1196 After this, install it on your PC. Look for the location where PYTHON has been installed on you
1197 Then go to advanced system settings and add a new variable and name it as PYTHON_NAME and paste
1198 Look for the path variable, select its value and select 'edit'.
1199 Add a semicolon towards the end of the value if it's not present and then type %PYTHON_HOME%
1200
1201
1202 123. Is indentation required in python?
1203 Ans:Indentation is necessary for Python. It specifies a block of code. All code within loops, c
1204
1205 124. What is the difference between Python Arrays and lists?
1206 Ans:Arrays and lists, in Python, have the same way of storing data. But, arrays can hold only a
1207
1208 Example:
1209
1210 1
1211 2
1212 3
1213 4
1214 5
1215 import array as arr
1216 My_Array=arr.array('i',[1,2,3,4])
1217 My_list=[1,'abc',1.20]
1218 print(My_Array)
1219 print(My_list)
1220 Output:
1221
1222 array('i', [1, 2, 3, 4]) [1, 'abc', 1.2]
1223
1224 125. What are functions in Python?
1225 Ans:A function is a block of code which is executed only when it is called. To define a Python
1226
1227 Example:
1228
```

```
1229 1
1230 2
1231 3
1232 def Newfunc():
1233     print("Hi, Welcome to Edureka")
1234     Newfunc(); #calling the function
1235     Output: Hi, Welcome to Edureka
1236
1237 126.What is __init__?
1238 Ans:__init__ is a method or constructor in Python. This method is automatically called to alloc
1239
1240 Here is an example of how to use it.
1241
1242 1
1243 2
1244 3
1245 4
1246 5
1247 6
1248 7
1249 8
1250 9
1251 10
1252 11
1253 class Employee:
1254     def __init__(self, name, age,salary):
1255         self.name = name
1256         self.age = age
1257         self.salary = 20000
1258     E1 = Employee("XYZ", 23, 20000)
1259     # E1 is the instance of class Employee.
1260     #__init__ allocates memory for E1.
1261     print(E1.name)
1262     print(E1.age)
1263     print(E1.salary)
1264     Output:
1265
1266
1267
1268     XYZ
1269
1270     23
1271
1272     20000
1273
1274
1275
1276 127.What is a lambda function?
1277 Ans:An anonymous function is known as a lambda function. This function can have any number of p
1278
1279 Example:
1280
```

```
1281 1
1282 2
1283 a = lambda x,y : x+y
1284 print(a(5, 6))
1285 Output: 11
1286
1287 128. What is self in Python?
1288 Ans:Self is an instance or an object of a class. In Python, this is explicitly included as the
1289
1290 The self variable in the init method refers to the newly created object while in other methods,
1291
1292 129. How does break, continue and pass work?
1293 Break    Allows loop termination when some condition is met and the control is transferred to the
1294 Continue    Allows skipping some part of a loop when some specific condition is met and the
1295 Pass    Used when you need some block of code syntactically, but you want to skip its execution
1296 130. What does [::-1] do?
1297 Ans: [::-1] is used to reverse the order of an array or a sequence.
1298 For example:
1299 1
1300 2
1301 3
1302 import array as arr
1303 My_Array=arr.array('i',[1,2,3,4,5])
1304 My_Array[::-1]
1305 Output: array('i', [5, 4, 3, 2, 1])
1306
1307 [::-1] reprints a reversed copy of ordered data structures such as an array or a list. the original
1308
1309
1310 131. How can you randomize the items of a list in place in Python?
1311 Ans: Consider the example shown below:
1312
1313 1
1314 2
1315 3
1316 4
1317 from random import shuffle
1318 x = ['Keep', 'The', 'Blue', 'Flag', 'Flying', 'High']
1319 shuffle(x)
1320 print(x)
1321 The output of the following code is as below.
1322
1323 ['Flying', 'Keep', 'Blue', 'High', 'The', 'Flag']
1324 132. What are python iterators?
1325 Ans:Iterators are objects which can be traversed though or iterated upon.
1326
1327 133. How can you generate random numbers in Python?
1328 Ans: Random module is the standard module that is used to generate a random number. The method
1329
1330 1
1331 2
1332 import random
```

```
1333 random.random
1334 The statement random.random() method return the floating point number that is in the range of
1335
1336 randrange(a, b): it chooses an integer and define the range in-between [a, b). It returns the e
1337 uniform(a, b): it chooses a floating point number that is defined in the range of [a,b).Iyt ret
1338 normalvariate(mean, sdev): it is used for the normal distribution where the mu is a mean and th
1339 The Random class that is used and instantiated creates an independent multiple random number ge
1340 134. What is the difference between range & xrange?
1341 Ans: For the most part, xrange and range are the exact same in terms of functionality. They bot
1342
1343 This means that xrange doesn't actually generate a static list at run-time like range does. It
1344
1345 This is especially true if you have a really memory sensitive system such as a cell phone that
1346
1347 135. How do you write comments in python?
1348 Ans:Comments in Python start with a # character. However, alternatively at times, commenting is
1349
1350 Example:
1351
1352 #Comments in Python start like this
1353 print("Comments in Python start with a #")
1354 Output: Comments in Python start with a #
1355
1356 136. What is pickling and unpickling?
1357 Ans: Pickle module accepts any Python object and converts it into a string representation and c
1358
1359 137. What are the generators in python?
1360 Ans: Functions that return an iterable set of items are called generators.
1361
1362 138. How will you capitalize the first letter of string?
1363 Ans:In Python, the capitalize() method capitalizes the first letter of a string. If the string
1364
1365 139. How will you convert a string to all lowercase?
1366 Ans:To convert a string to lowercase, lower() function can be used.
1367
1368 Example:
1369
1370 1
1371 2
1372 stg='ABCD'
1373 print(stg.lower())
1374 Output: abcd
1375
1376 140. How to comment multiple lines in python?
1377 Ans: Multi-line comments appear in more than one line. All the lines to be commented are to be
1378
1379 141.What are docstrings in Python?
1380 Ans:Docstrings are not actually comments, but, they are documentation strings. These docstrings
1381
1382 Example:
1383
1384 1
```

```
1385 2
1386 3
1387 4
1388 5
1389 6
1390 7
1391 8
1392 """
1393 Using docstring as a comment.
1394 This code divides 2 numbers
1395 """
1396 x=8
1397 y=4
1398 z=x/y
1399 print(z)
1400 Output: 2.0
1401
1402 141. What is the purpose of is, not and in operators?
1403 Ans:Operators are special functions. They take one or more values and produce a corresponding r
1404
1405 is: returns true when 2 operands are true (Example: "a" is 'a')
1406
1407 not: returns the inverse of the boolean value
1408
1409 in: checks if some element is present in some sequence
1410
1411 142. What is the usage of help() and dir() function in Python?
1412 Ans: Help() and dir() both functions are accessible from the Python interpreter and used for vi
1413
1414 Help() function: The help() function is used to display the documentation string and also faci
1415 Dir() function: The dir() function is used to display the defined symbols.
1416 143. Whenever Python exits, why isn't all the memory de-allocated?
1417 Ans:
1418
1419 Whenever Python exits, especially those Python modules which are having circular references to
1420 It is impossible to de-allocate those portions of memory that are reserved by the C library.
1421 On exit, because of having its own efficient clean up mechanism, Python would try to de-allocat
1422 143. What is a dictionary in Python?
1423 Ans: The built-in datatypes in Python is called dictionary. It defines one-to-one relationship
1424
1425 Let's take an example:
1426
1427 The following example contains some keys. Country, Capital & PM. Their corresponding values are
1428
1429 1
1430 dict={'Country':'India','Capital':'Delhi','PM':'Modi'}
1431 1
1432 print dict[Country]
1433 India
1434 1
1435 print dict[Capital]
1436 Delhi
```

```
1437 1
1438 print dict[PM]
1439 Modi
1440 144. How can the ternary operators be used in python?
1441 Ans: The Ternary operator is the operator that is used to show the conditional statements. This
1442
1443 Syntax:
1444
1445 The Ternary operator will be given as:
1446 [on_true] if [expression] else [on_false]x, y = 25, 50big = x if x < y else y
1447
1448 Example:
1449
1450 The expression gets evaluated like if x<y else y, in this case if x<y is true then the value is
1451
1452 146. What does this mean: *args, **kwargs? And why would we use it?
1453 Ans: We use *args when we aren't sure how many arguments are going to be passed to a function,
1454
1455 147. What does len() do?
1456 Ans:It is used to determine the length of a string, a list, an array, etc.
1457
1458 Example:
1459
1460 1
1461 2
1462 stg='ABCD'
1463 len(stg)
1464 148. Explain split(), sub(), subn() methods of "re" module in Python.
1465 Ans: To modify the strings, Python's "re" module is providing 3 methods. They are:
1466
1467 split() - uses a regex pattern to "split" a given string into a list.
1468 sub() - finds all substrings where the regex pattern matches and then replace them with a differ
1469 subn() - it is similar to sub() and also returns the new string along with the no. of replaceme
1470 149. What are negative indexes and why are they used?
1471 Ans: The sequences in Python are indexed and it consists of the positive as well as negative nu
1472
1473 The index for the negative number starts from '-1' that represents the last index in the sequen
1474
1475 The negative index is used to remove any new-line spaces from the string and allow the string t
1476
1477 150. What are Python packages?
1478 Ans: Python packages are namespaces containing multiple modules.
1479 151.How can files be deleted in Python?
1480 Ans: To delete a file in Python, you need to import the OS Module. After that, you need to use
1481
1482 Example:
1483
1484 1
1485 2
1486 import os
1487 os.remove("xyz.txt")
1488 152. What are the built-in types of python?
```

1489 Ans: Built-in types in Python are as follows -

1490

1491 Integers

1492 Floating-point

1493 Complex numbers

1494 Strings

1495 Boolean

1496 Built-in functions

1497 153. What advantages do NumPy arrays offer over (nested) Python lists?

1498 Ans:

1499

1500 Python's lists are efficient general-purpose containers. They support (fairly) efficient insert

1501 They have certain limitations: they don't support "vectorized" operations like elementwise addi

1502 NumPy is not just more efficient; it is also more convenient. You get a lot of vector and matric

1503 NumPy array is faster and You get a lot built in with NumPy, FFTs, convolutions, fast searching

1504 154. How to add values to a python array?

1505 Ans: Elements can be added to an array using the append(), extend() and the insert (i,x) functi

1506

1507 Example:

1508

1509 1

1510 2

1511 3

1512 4

1513 5

1514 6

1515 7

1516 a=arr.array('d', [1.1 , 2.1 ,3.1] )

1517 a.append(3.4)

1518 print(a)

1519 a.extend([4.5,6.3,6.8])

1520 print(a)

1521 a.insert(2,3.8)

1522 print(a)

1523 Output:

1524

1525 array('d', [1.1, 2.1, 3.1, 3.4])

1526

1527 array('d', [1.1, 2.1, 3.1, 3.4, 4.5, 6.3, 6.8])

1528

1529 array('d', [1.1, 2.1, 3.8, 3.1, 3.4, 4.5, 6.3, 6.8])

1530

1531 155. How to remove values to a python array?

1532 Ans: Array elements can be removed using pop() or remove() method. The difference between these

1533

1534 Example:

1535

1536 a=arr.array('d', [1.1, 2.2, 3.8, 3.1, 3.7, 1.2, 4.6])

1537 print(a.pop())

1538 print(a.pop(3))

1539 a.remove(1.1)

1540 print(a)

```
1541 Output:
1542
1543 4.6
1544
1545 3.1
1546
1547 array('d', [2.2, 3.8, 3.7, 1.2])
1548
1549
1550
1551 156. Does Python have OOps concepts?
1552 Ans: Python is an object-oriented programming language. This means that any program can be solved
1553
1554 157. What is the difference between deep and shallow copy?
1555 Ans: Shallow copy is used when a new instance type gets created and it keeps the values that are
1556
1557 Deep copy is used to store the values that are already copied. Deep copy doesn't copy the references.
1558
1559 158. How is Multithreading achieved in Python?
1560 Ans:
1561
1562 Python has a multi-threading package but if you want to multi-thread to speed your code up, the
1563 Python has a construct called the Global Interpreter Lock (GIL). The GIL makes sure that only one
1564 This happens very quickly so to the human eye it may seem like your threads are executing in parallel.
1565 All this GIL passing adds overhead to execution. This means that if you want to make your code
1566
1567 159. What is the process of compilation and linking in python?
1568 Ans: The compiling and linking allows the new extensions to be compiled properly without any errors.
1569
1570 The steps that are required in this as:
1571
1572 Create a file with any name and in any language that is supported by the compiler of your system.
1573 Place this file in the Modules/ directory of the distribution which is getting used.
1574 Add a line in the file Setup.local that is present in the Modules/ directory.
1575 Run the file using spam file.o
1576 After a successful run of this rebuild the interpreter by using the make command on the top-level.
1577 If the file is changed then run rebuildMakefile by using the command as 'make Makefile'.
1578
1579 160. What are Python libraries? Name a few of them.
1580 Ans: Python libraries are a collection of Python packages. Some of the majorly used python libraries are:
1581
1582 161. What is split used for?
1583 Ans: The split() method is used to separate a given string in Python.
1584
1585 Example:
1586
1587 1
1588 2
1589 a="KausalVikash python"
1590 print(a.split())
1591 Output: ['KausalVikash', 'python']
1592
1593 162. How to import modules in python?
1594 Ans: Modules can be imported using the import keyword. You can import modules in three ways-
```

```
1593
1594 Example:
1595
1596 1
1597 2
1598 3
1599 import array          #importing using the original module name
1600 import array as arr    # importing using an alias name
1601 from array import *     #imports everything present in the array module
1602
1603
1604 163. Explain Inheritance in Python with an example.
1605 Ans: Inheritance allows One class to gain all the members(say attributes and methods) of another
1606
1607 They are different types of inheritance supported by Python:
1608
1609 Single Inheritance - where a derived class acquires the members of a single super class.
1610 Multi-level inheritance - a derived class d1 is inherited from base class base1, and d2 is inherited from d1
1611 Hierarchical inheritance - from one base class you can inherit any number of child classes
1612 Multiple inheritance - a derived class is inherited from more than one base class.
1613
1614
1615 164. How are classes created in Python?
1616 Ans: Class in Python is created using the class keyword.
1617
1618 Example:
1619
1620 1
1621 2
1622 3
1623 4
1624 5
1625 class Employee:
1626     def __init__(self, name):
1627         self.name = name
1628     E1=Employee("abc")
1629     print(E1.name)
1630 Output: abc
1631
1632 165. What is monkey patching in Python?
1633 Ans: In Python, the term monkey patch only refers to dynamic modifications of a class or module
1634
1635 Consider the below example:
1636
1637 1
1638 2
1639 3
1640 4
1641 # m.py
1642 class MyClass:
1643     def f(self):
1644         print "f()"
```

1645 We can then run the monkey-patch testing like this:

1646

1647 1

1648 2

1649 3

1650 4

1651 5

1652 6

1653 7

1654 import m

1655 def monkey\_f(self):

1656 print "monkey\_f()"

1657 m.MyClass.f = monkey\_f

1658 obj = m.MyClass()

1659 obj.f()

1660 The output will be as below:

1661

1662 monkey\_f()

1663 As we can see, we did make some changes in the behavior of f() in MyClass using the function we

1664

1665 166. Does python support multiple inheritance?

1666 Ans: Multiple inheritance means that a class can be derived from more than one parent classes.

1667

1668 167. What is Polymorphism in Python?

1669 Ans: Polymorphism means the ability to take multiple forms. So, for instance, if the parent class

1670

1671 168. Define encapsulation in Python?

1672 Ans: Encapsulation means binding the code and the data together. A Python class is an example of

1673

1674 169. How do you do data abstraction in Python?

1675 Ans: Data Abstraction is providing only the required details and hiding the implementation from

1676

1677 170. Does python make use of access specifiers?

1678 Ans: Python does not deprive access to an instance variable or function. Python lays down the concept

1679 171. How to create an empty class in Python?

1680 Ans: An empty class is a class that does not have any code defined within its block. It can be

1681 For example-

1682 1

1683 2

1684 3

1685 4

1686 5

1687 class a:

1688 &nbsp; pass

1689 obj=a()

1690 obj.name="xyz"

1691 print("Name = ",obj.name)

1692 Output:

1693

1694 Name = xyz

1695

1696

172.What's The Process To Get The Home Directory Using '~' In Python?

Ans: You need to import the os module, and then just a single line would do the rest.

```
import os
```

```
print (os.path.expanduser('~'))
```

Output:

```
/home/runner
```

173.How To Find Bugs Or Perform Static Analysis In A Python Application?

Ans:

You can use PyChecker, which is a static analyzer. It identifies the bugs in Python project and

Another tool is Pylint, which checks whether the Python module satisfies the coding standard.

174.When Is The Python Decorator Used?

Ans: Python decorator is a relative change that you do in Python syntax to adjust the functions

175.Can Python be used for web client and web server side programming? And which one is best su

Ans: Python is best suited for web server-side application development due to its vast set of

However, Python can be used as a web client-side application which needs some conversions for a

176. Mention at least 3-4 benefits of using Python over the other scripting languages such as J

Ans: Enlisted below are some of the benefits of using Python.

Application development is faster and easy.

Extensive support of modules for any kind of application development including data analytics/m

An excellent support community to get your answers.

177.What is the type () in Python?

Ans: The built-in method which decides the types of the variable at the program runtime is know

178.What are the key points of Python?

Ans:

Similar to PERL and PHP, Python is processed by the interpreter at runtime. Python supports Obj

Derived from other languages, such as ABC, C, C++, Modula-3, SmallTalk, Algol-68, Unix shell, a

Python is copyrighted, and its source code is available under the GNU General Public License (G

Supports the development of many applications, from text processing to games.

Works for scripting, embedded code and compiled the code.

Detailed

179.How is memory managed in Python?

Ans: Memory is managed by the private heap space. All objects and data structures are located i

180.What tools can help find bugs or perform the static analysis?

Ans: For performing Static Analysis, PyChecker is a tool that detects the bugs in source code and

181.How Does Python Handle Memory Management?

Ans:

Python uses private heaps to maintain its memory. So the heap holds all the Python objects and  
And it's the Python memory manager that handles the Private heap. It does the required allocation  
Python employs a built-in garbage collector, which salvages all the unused memory and offloads

182.What Are The Principal Differences Between The Lambda And Def?

Ans:

Lambda Vs. Def.

Def can hold multiple expressions while lambda is a uni-expression function.

Def generates a function and designates a name to call it later. Lambda forms a function object

Def can have a return statement. Lambda can't have return statements.

Lambda supports to get used inside a list and dictionary.

183.Write A Reg Expression That Confirms An Email Id Using The Python Reg Expression Module "re"

Ans: Python has a regular expression module "re."

Check out the "re" expression that can check the email id for .com and .co.in subdomain.

```
import re
```

```
print(re.search(r"[0-9a-zA-Z.]+@[a-zA-Z]+\.(com|co\.in)$", "micheal.pages@mp.com"))
```

184.What Do You Think Is The Output Of The Following Code Fragment? Is There Any Error In The Code?

Ans:

```
list = ['a', 'b', 'c', 'd', 'e']
```

```
print (list[10:])
```

The result of the above lines of code is []. There won't be any error like an IndexError.

You should know that trying to fetch a member from the list using an index that exceeds the length

185. Is There A Switch Or Case Statement In Python? If Not Then What Is The Reason For The Same?

Ans: No, Python does not have a Switch statement, but you can write a Switch function and then

186.What Is A Built-In Function That Python Uses To Iterate Over A Number Sequence?

Ans: Range() generates a list of numbers, which is used to iterate over for loops.

```
for i in range(5):
```

```
1801     print(i)
1802 The range() function accompanies two sets of parameters.
1803
1804 range(stop)
1805 stop: It is the no. of integers to generate and starts from zero. eg. range(3) == [0, 1, 2].
1806 range([start], stop[, step])
1807 Start: It is the starting no. of the sequence.
1808 Stop: It specifies the upper limit of the sequence.
1809 Step: It is the incrementing factor for generating the sequence.
1810 Points to note:
1811 Only integer arguments are allowed.
1812 Parameters can be positive or negative.
1813 The range() function in Python starts from the zeroth index.
1814
1815
1816 187.What Are The Optional Statements Possible Inside A Try-Except Block In Python?
1817 Ans: There are two optional clauses you can use in the try-except block.
1818
1819 The "else" clause
1820 It is useful if you want to run a piece of code when the try block doesn't create an exception
1821 The "finally" clause
1822 It is useful when you want to execute some steps which run, irrespective of whether there occur
1823
1824
1825 188.What Is A String In Python?
1826 Ans: A string in Python is a sequence of alpha-numeric characters. They are immutable objects.
1827
1828 189. What Is Slicing In Python?
1829 Ans: Slicing is a string operation for extracting a part of the string, or some part of a list
1830
1831 190. What Is %S In Python?
1832 Ans: Python has support for formatting any value into a string. It may contain quite complex ex
1833
1834 One of the common usages is to push values into a string with the %s format specifier. The form
1835
1836 191.What Is The Index In Python?
1837 Ans: An index is an integer data type which denotes a position within an ordered list or a strin
1838
1839 In Python, strings are also lists of characters. We can access them using the index which begin
1840
1841 For example, in the string "Program," the indexing happens like this:
1842
1843 Program 0 1 2 3 4 5
1844 192. What Is Docstring In Python?
1845 Ans: A docstring is a unique text that happens to be the first statement in the following Python
1846
1847 Module, Function, Class, or Method definition.
1848
1849 A docstring gets added to the __doc__ attribute of the string object.
1850
1851
1852
```

1853 193.What Is A Function In Python Programming?

1854 Ans: A function is an object which represents a block of code and is a reusable entity. It brings  
1855

1856 Python has given us many built-in functions such as print() and provides the ability to create  
1857

1858 194. How Many Basic Types Of Functions Are Available In Python?

1859 Ans: Python gives us two basic types of functions.

1860

1861 1. Built-in, and

1862

1863 2. User-defined.

1864

1865 The built-in functions happen to be part of the Python language. Some of these are print(), dir  
1866

1867 195. How Do We Write A Function In Python?

1868 Ans: We can create a Python function in the following manner.

1869

1870 Step-1: to begin the function, start writing with the keyword def and then mention the function  
1871

1872 Step-2: We can now pass the arguments and enclose them using the parentheses. A colon, in the e  
1873

1874 Step-3: After pressing an enter, we can add the desired Python statements for execution.  
1875

1876

1876 196. What Is A Function Call Or A Callable Object In Python?

1877 Ans: A function in Python gets treated as a callable object. It can allow some arguments and al  
1878

1879 197. What Is The Return Keyword Used For In Python?

1880 Ans: The purpose of a function is to receive the inputs and return some output.

1881

1882 The return is a Python statement which we can use in a function for sending a value back to its  
1883

1884 198. What Is “Call By Value” In Python?

1885 Ans: In call-by-value, the argument whether an expression or a value gets bound to the respecti  
1886

1887 Python will treat that variable as local in the function-level scope. Any changes made to that  
1888

1889 199. What Is “Call By Reference” In Python?

1890 Ans: We use both “call-by-reference” and “pass-by-reference” interchangeably. When we pass an a  
1891

1892 This scheme also has the advantage of bringing more time and space efficiency because it leaves  
1893

1894 On the contrary, the disadvantage could be that a variable can get changed accidentally during  
1895

1896 200. What Is The Return Value Of The Trunc() Function?

1897 Ans: The Python trunc() function performs a mathematical operation to remove the decimal values

1898 201. Is It Mandatory For A Python Function To Return A Value?

1899 Ans: It is not at all necessary for a function to return any value. However, if needed, we can  
1900

1901 202. What Does The Continue Do In Python?

1902 Ans: The continue is a jump statement in Python which moves the control to execute the next ite  
1903

1904 The continue statement is applicable for both the “while” and “for” loops.

```
1905
1906 203. What Is The Purpose Of Id() Function In Python?
1907 Ans: The id() is one of the built-in functions in Python.
1908
1909 Signature: id(object)
1910 It accepts one parameter and returns a unique identifier associated with the input object.
1911
1912 204. What Does The *Args Do In Python?
1913 Ans: We use *args as a parameter in the function header. It gives us the ability to pass N (var
1914
1915 Please note that this type of argument syntax doesn't allow passing a named argument to the fur
1916
1917 Example of using the *args:
1918
1919 # Python code to demonstrate
1920 # *args for dynamic arguments
1921 def fn(*argList):
1922     for argx in argList:
1923         print (argx)
1924
1925 fn('I', 'am', 'Learning', 'Python')
1926 The output:
1927
1928 I
1929 am
1930 Learning
1931 Python
1932
1933
1934 205.Does Python Have A Main() Method?
1935 Ans: The main() is the entry point function which happens to be called first in most programmin
1936
1937 Since Python is interpreter-based, so it sequentially executes the lines of the code one-by-one
1938
1939 Python also does have a Main() method. But it gets executed whenever we run our Python script e
1940
1941 We can also override the Python default main() function using the Python if statement. Please s
1942
1943 print("Welcome")
1944 print("__name__ contains: ", __name__)
1945 def main():
1946     print("Testing the main function")
1947 if __name__ == '__main__':
1948     main()
1949 The output:
1950
1951 Welcome
1952 __name__ contains: __main__
1953 Testing the main function
1954 206. What Does The __ Name __ Do In Python?
1955 Ans: The __name__ is a unique variable. Since Python doesn't expose the main() function, so whe
1956
```

```
1957 To see whether the main() gets called, we can use the __name__ variable in an if clause compare
1958
1959 207. What Is The Purpose Of “End” In Python?
1960 Ans: Python’s print() function always prints a newline in the end. The print() function accepts
1961
1962 # Example: Print a instead of the new line in the end.
1963 print("Let's learn" , end = ' ')
1964 print("Python")
1965
1966 # Printing a dot in the end.
1967 print("Learn to code from techbeamers" , end = '.')
1968 print("com", end = ' ')
1969 The output is:
1970
1971 Let's learn Python
1972 Learn to code from techbeamers.com
1973 208. When Should You Use The “Break” In Python?
1974 Ans: Python provides a break statement to exit from a loop. Whenever the break hits in the code
1975
1976 The break statement in a nested loop causes the control to exit from the inner iterative block
1977
1978
1979
1980 209.What Is The Difference Between Pass And Continue In Python?
1981 Ans: The continue statement makes the loop to resume from the next iteration.
1982
1983 On the contrary, the pass statement instructs to do nothing, and the remainder of the code execu
1984
1985 210. What Does The Len() Function Do In Python?
1986 Ans: In Python, the len() is a primary string function. It determines the length of an input str
1987
1988 >>> some_string = 'techbeamers'
1989 >>> len(some_string)
1990 11
1991 211. What Does The Chr() Function Do In Python?
1992 Ans: The chr() function got re-added in Python 3.2. In version 3.0, it got removed.
1993
1994 It returns the string denoting a character whose Unicode code point is an integer.
1995
1996 For example, the chr(122) returns the string ‘z’ whereas the chr(1212) returns the string ‘e’.
1997
1998 212. What Does The Ord() Function Do In Python?
1999 Ans: The ord(char) in Python takes a string of size one and returns an integer denoting the Uni
2000
2001 >>> ord("z")
2002 122
2003 213. What Is Rstrip() In Python?
2004 Ans: Python provides the rstrip() method which duplicates the string but leaves out the whitesp
2005
2006 The rstrip() escapes the characters from the right end based on the argument value, i.e., a str
2007
2008 The signature of the rstrip() is:
```

```
2009
2010 str.rstrip([char sequence/pre>
2011 #Example
2012 test_str = 'Programming  '
2013 # The trailing whitespaces are excluded
2014 print(test_str.rstrip())
2015
2016
2017 214.What Is Whitespace In Python?
2018 Ans: Whitespace represents the characters that we use for spacing and separation.
2019
2020 They possess an “empty” representation. In Python, it could be a tab or space.
2021
2022 215. What Is Isalpha() In Python?
2023 Ans: Python provides this built-in isalpha() function for the string handling purpose.
2024
2025 It returns True if all characters in the string are of alphabet type, else it returns False.
2026
2027 216. How Do You Use The Split() Function In Python?
2028 Python’s split() function works on strings to cut a large piece into smaller chunks, or sub-str
2029
2030 #Example
2031 str = 'pdf csv json'
2032 print(str.split(" "))
2033 print(str.split())
2034 The output:
2035
2036 ['pdf', 'csv', 'json']
2037 ['pdf', 'csv', 'json']
2038 217. What Does The Join Method Do In Python?
2039 Ans: Python provides the join() method which works on strings, lists, and tuples. It combines t
2040
2041 218. What Does The Title() Method Do In Python?
2042 Ans: Python provides the title() method to convert the first letter in each word to capital for
2043
2044 #Example
2045 str = 'lEaRn pYtHoN'
2046 print(str.title())
2047 The output:
2048
2049 Learn Python
2050 Now, check out some general purpose Python interview questions.
2051
2052 219. What Makes The CPython Different From Python?
2053 Ans: CPython has its core developed in C. The prefix ‘C’ represents this fact. It runs an inter
2054
2055 220. Which Package Is The Fastest Form Of Python?
2056 Ans: PyPy provides maximum compatibility while utilizing CPython implementation for improving i
2057
2058 The tests confirmed that PyPy is nearly five times faster than the CPython. It currently suppor
2059
2060 221. What Is GIL In Python Language?
```

2061 Ans: Python supports GIL (the global interpreter lock) which is a mutex used to secure access t  
2062  
2063 222. How Is Python Thread Safe?  
2064 Ans: Python ensures safe access to threads. It uses the GIL mutex to set synchronization. If a  
2065  
2066 For example, many of the Python operations execute as atomic such as calling the sort() method  
2067  
2068 223. How Does Python Manage The Memory?  
2069 Ans: Python implements a heap manager internally which holds all of its objects and data struct  
2070  
2071 This heap manager does the allocation/de-allocation of heap space for objects.  
2072  
2073  
2074  
2075 224.What Is The Set Object In Python?  
2076 Ans: Sets are unordered collection objects in Python. They store unique and immutable objects.  
2077  
2078 225. What Is The Use Of The Dictionary In Python?  
2079 Ans: A dictionary has a group of objects (the keys) map to another group of objects (the values  
2080  
2081 They are mutable and hence will not change. The values associated with the keys can be of any f  
2082  
2083 226. Is Python List A Linked List?  
2084 Ans: A Python list is a variable-length array which is different from C-style linked lists.  
2085  
2086 Internally, it has a contiguous array for referencing to other objects and stores a pointer to  
2087  
2088 Here are some Python interview questions on classes and objects  
2089  
2090  
2091  
2092 227.What Is Class In Python?  
2093 Ans: Python supports object-oriented programming and provides almost all OOP features to use in  
2094  
2095 A Python class is a blueprint for creating the objects. It defines member variables and gets th  
2096  
2097 We can make it by using the keyword "class." An object gets created from the constructor. This  
2098  
2099 In Python, we generate classes and instances in the following way.  
2100  
2101 >>>class Human: # Create the class  
2102 ... pass  
2103 >>>man = Human() # Create the instance  
2104 >>>print(man)  
2105 <\_\_main\_\_.Human object at 0x0000000003559E10>  
2106 228. What Are Attributes And Methods In A Python Class?  
2107 Ans: A class is useless if it has not defined any functionality. We can do so by adding attribu  
2108  
2109 >>> class Human:  
2110 ... profession = "programmer" # specify the attribute 'profession' of the class  
2111 >>> man = Human()  
2112 >>> print(man.profession)

```
2113 programmer
2114 After we added the attributes, we can go on to define the functions. Generally, we call them me
2115
2116 >>> class Human:
2117     profession = "programmer"
2118     def set_profession(self, new_profession):
2119         self.profession = new_profession
2120
2121 >>> man = Human()
2122 >>> man.set_profession("Manager")
2123 >>> print(man.profession)
2124 Manager
2125 229. How To Assign Values For The Class Attributes At Runtime?
2126 Ans: We can specify the values for the attributes at runtime. We need to add an init method and
2127
2128 >>> class Human:
2129     def __init__(self, profession):
2130         self.profession = profession
2131     def set_profession(self, new_profession):
2132         self.profession = new_profession
2133
2134 >>> man = Human("Manager")
2135 >>> print(man.profession)
2136 Manager
2137 230.What Is Inheritance In Python Programming?
2138 Ans: Inheritance is an OOP mechanism which allows an object to access its parent class features
2139
2140 Python Interview Questions - Inheritance
2141
2142 We do it intentionally to abstract away the similar code in different classes.
2143
2144 The common code rests with the base class, and the child class objects can access it via inheri
2145
2146 class PC: # Base class
2147     processor = "Xeon" # Common attribute
2148     def set_processor(self, new_processor):
2149         processor = new_processor
2150
2151 class Desktop(PC): # Derived class
2152     os = "Mac OS High Sierra" # Personalized attribute
2153     ram = "32 GB"
2154
2155 class Laptop(PC): # Derived class
2156     os = "Windows 10 Pro 64" # Personalized attribute
2157     ram = "16 GB"
2158
2159 desk = Desktop()
2160 print(desk.processor, desk.os, desk.ram)
2161
2162 lap = Laptop()
2163 print(lap.processor, lap.os, lap.ram)
2164 The output:
```

```
2165 Xeon Mac OS High Sierra 32 GB
2166 Xeon Windows 10 Pro 64 16 GB
2167
2168
2169 231.What Is Composition In Python?
2170 Ans: The composition is also a type of inheritance in Python. It intends to inherit from the base class.
2171
2172 See the below diagram.
2173
2174 Python Interview Questions - Composition
2175
2176 To demonstrate composition, we need to instantiate other objects in the class and then make use of them.
2177
2178 class PC: # Base class
2179     processor = "Xeon" # Common attribute
2180     def __init__(self, processor, ram):
2181         self.processor = processor
2182         self.ram = ram
2183
2184     def set_processor(self, new_processor):
2185         processor = new_processor
2186
2187     def get_PC(self):
2188         return "%s cpu & %s ram" % (self.processor, self.ram)
2189
2190 class Tablet():
2191     make = "Intel"
2192     def __init__(self, processor, ram, make):
2193         self.PC = PC(processor, ram) # Composition
2194         self.make = make
2195
2196     def get_Tablet(self):
2197         return "Tablet with %s CPU & %s ram by %s" % (self.PC.processor, self.PC.ram, self.make)
2198
2199 if __name__ == "__main__":
2200     tab = Tablet("i7", "16 GB", "Intel")
2201     print(tab.get_Tablet())
2202 The output is:
2203
2204 Tablet with i7 CPU & 16 GB ram by Intel
2205
2206
2207
2208 232.What Are Errors And Exceptions In Python Programs?
2209 Ans: Errors are coding issues in a program which may cause it to exit abnormally.
2210
2211 On the contrary, exceptions happen due to the occurrence of an external event which interrupts the program.
2212
2213 233. How Do You Handle Exceptions With Try/Except/Finally In Python?
2214 Ans: Python lay down Try, Except, Finally constructs to handle errors as well as Exceptions. We use try-except-finally to handle exceptions.
2215
2216 try:
```

```
2217     print("Executing code in the try block")
2218     print(exception)
2219 except:
2220     print("Entering in the except block")
2221 finally:
2222     print("Reached to the final block")
2223 The output is:
2224
2225 Executing code in the try block
2226 Entering in the except block
2227 Reached to the final block
2228 234. How Do You Raise Exceptions For A Predefined Condition In Python?
2229 Ans: We can raise an exception based on some condition.
2230
2231 For example, if we want the user to enter only odd numbers, else will raise an exception.
2232
2233 # Example - Raise an exception
2234 while True:
2235     try:
2236         value = int(input("Enter an odd number- "))
2237         if value%2 == 0:
2238             raise ValueError("Exited due to invalid input!!!")
2239         else:
2240             print("Value entered is : %s" % value)
2241     except ValueError as ex:
2242         print(ex)
2243         break
2244 The output is:
2245
2246 Enter an odd number- 2
2247 Exited due to invalid input!!!
2248 Enter an odd number- 1
2249 Value entered is : 1
2250 Enter an odd number-
2251 235. What Are Python Iterators?
2252 Ans: Iterators in Python are array-like objects which allow moving on the next element. We use
2253
2254 Python library has a no. of iterators. For example, a list is also an iterator and we can start
2255
2256 236. What Is The Difference Between An Iterator And Iterable?
2257 Ans: The collection type like a list, tuple, dictionary, and set are all iterable objects where
2258
2259 Here are some advanced-level Python interview questions.
2260
2261 237. What Are Python Generators?
2262 Ans: A Generator is a kind of function which lets us specify a function that acts like an iter
2263
2264 In a generator function, the yield keyword substitutes the return statement.
2265
2266 # Simple Python function
2267 def fn():
2268     return "Simple Python function."
```

```
2269
2270 # Python Generator function
2271 def generate():
2272     yield "Python Generator function."
2273
2274 print(next(generate()))
2275 The output is:
2276
2277 Python Generator function.
2278
2279
2280 238.What Are Closures In Python?
2281 Ans: Python closures are function objects returned by another function. We use them to eliminat
2282
2283 In the example below, we've written a simple closure for multiplying numbers.
2284
2285 def multiply_number(num):
2286     def product(number):
2287         'product() here is a closure'
2288         return num * number
2289     return product
2290
2291 num_2 = multiply_number(2)
2292 print(num_2(11))
2293 print(num_2(24))
2294
2295 num_6 = multiply_number(6)
2296 print(num_6(1))
2297 The output is:
2298
2299 22
2300 48
2301 6
2302 239. What Are Decorators In Python?
2303 Ans: Python decorator gives us the ability to add new behavior to the given objects dynamically
2304
2305 def decorator_sample(func):
2306     def decorator_hook(*args, **kwargs):
2307         print("Before the function call")
2308         result = func(*args, **kwargs)
2309         print("After the function call")
2310         return result
2311     return decorator_hook
2312
2313 @decorator_sample
2314 def product(x, y):
2315     "Function to multiply two numbers."
2316     return x * y
2317
2318 print(product(3, 3))
2319 The output is:
2320
```

```
2321 Before the function call
2322 After the function call
2323 9
2324 240. How Do You Create A Dictionary In Python?
2325 Ans: Let's take the example of building site statistics. For this, we first need to break up th
2326
2327 However, we can take values of any kind. For distinguishing the data pairs, we can use a comma
2328
2329 >>> site_stats = {'site': 'tecbeamers.com', 'traffic': 10000, "type": "organic"}
2330 >>> type(site_stats)
2331 <class 'dict'>
2332 >>> print(site_stats)
2333 {'type': 'organic', 'site': 'tecbeamers.com', 'traffic': 10000}
2334 241. How Do You Read From A Dictionary In Python?
2335 Ans: To fetch data from a dictionary, we can directly access using the keys. We can enclose a "f
2336
2337 >>> site_stats = {'site': 'tecbeamers.com', 'traffic': 10000, "type": "organic"}
2338 >>> print(site_stats["traffic"])
2339 We can even call the get method to fetch the values from a dict. It also let us set a default \
2340
2341 >>> site_stats = {'site': 'tecbeamers.com', 'traffic': 10000, "type": "organic"}
2342 >>> print(site_stats.get('site'))
2343 tecbeamers.com
2344 242. How Do You Traverse Through A Dictionary Object In Python?
2345 Ans: We can use the "for" and "in" loop for traversing the dictionary object.
2346
2347 >>> site_stats = {'site': 'tecbeamers.com', 'traffic': 10000, "type": "organic"}
2348 >>> for k, v in site_stats.items():
2349     print("The key is: %s" % k)
2350     print("The value is: %s" % v)
2351     print("+++++")
2352 The output is:
2353
2354 The key is: type
2355 The value is: organic
2356 ++++++
2357 The key is: site
2358 The value is: tecbeamers.com
2359 ++++++
2360 The key is: traffic
2361 The value is: 10000
2362 ++++++
2363 243. How Do You Add Elements To A Dictionary In Python?
2364 Ans: We can add elements by modifying the dictionary with a fresh key and then set the value to
2365
2366 >>> # Setup a blank dictionary
2367 >>> site_stats = {}
2368 >>> site_stats['site'] = 'google.com'
2369 >>> site_stats['traffic'] = 10000000000
2370 >>> site_stats['type'] = 'Referral'
2371 >>> print(site_stats)
2372 {'type': 'Referral', 'site': 'google.com', 'traffic': 10000000000}
```

```
2373 We can even join two dictionaries to get a bigger dictionary with the help of the update() method
2374
2375 >>> site_stats['site'] = 'google.co.in'
2376 >>> print(site_stats)
2377 {'site': 'google.co.in'}
2378 >>> site_stats_new = {'traffic': 1000000, "type": "social media"}
2379 >>> site_stats.update(site_stats_new)
2380 >>> print(site_stats)
2381 {'type': 'social media', 'site': 'google.co.in', 'traffic': 1000000}
2382 244. How Do You Delete Elements Of A Dictionary In Python?
2383 Ans: We can delete a key in a dictionary by using the del() method.
2384
2385 >>> site_stats = {'site': 'tecbeamers.com', 'traffic': 10000, "type": "organic"}
2386 >>> del site_stats["type"]
2387 >>> print(site_stats)
2388 {'site': 'tecbeamers.com', 'traffic': 10000}
2389 Another method, we can use is the pop() function. It accepts the key as the parameter. Also, a
2390
2391 >>> site_stats = {'site': 'tecbeamers.com', 'traffic': 10000, "type": "organic"}
2392 >>> print(site_stats.pop("type", None))
2393 organic
2394 >>> print(site_stats)
2395 {'site': 'tecbeamers.com', 'traffic': 10000}
2396 245. How Do You Check The Presence Of A Key In A Dictionary?
2397 Ans: We can use Python's "in" operator to test the presence of a key inside a dict object.
2398
2399 >>> site_stats = {'site': 'tecbeamers.com', 'traffic': 10000, "type": "organic"}
2400 >>> 'site' in site_stats
2401 True
2402 >>> 'traffic' in site_stats
2403 True
2404 >>> "type" in site_stats
2405 True
2406 Earlier, Python also provided the has_key() method which got deprecated.
2407
2408 246. What Is The Syntax For List Comprehension In Python?
2409 Ans: The signature for the list comprehension is as follows:
2410
2411 [ expression(var) for var in iterable ]
2412 For example, the below code will return all the numbers from 10 to 20 and store them in a list
2413
2414 >>> alist = [var for var in range(10, 20)]
2415 >>> print(alist)
2416 247. What Is The Syntax For Dictionary Comprehension In Python?
2417 A dictionary has the same syntax as was for the list comprehension but the difference is that it
2418
2419 { aKey, itsValue for aKey in iterable }
2420 For example, the below code will return all the numbers 10 to 20 as the keys and will store the
2421
2422 >>> adict = {var:var**2 for var in range(10, 20)}
2423 >>> print(adict)
2424 248. What Is The Syntax For Generator Expression In Python?
```

```
2425 Ans: The syntax for generator expression matches with the list comprehension, but the difference
2426
2427 ( expression(var) for var in iterable )
2428 For example, the below code will create a generator object that generates the values from 10 to 20
2429
2430 >>> (var for var in range(10, 20))
2431      at 0x0000000003668728>
2432 >>> list((var for var in range(10, 20)))
2433 Now, see more Python interview questions for practice.
```

2435 249. How Do You Write A Conditional Expression In Python?

```
2436 Ans: We can utilize the following single statement as a conditional expression. default_statment
2437
2438 >>> no_of_days = 366
2439 >>> is_leap_year = "Yes" if no_of_days == 366 else "No"
2440 >>> print(is_leap_year)
```

2441 Yes

2442 250. What Do You Know About The Python Enumerate?

2443 Ans: While using the iterators, sometimes we might have a use case to store the count of iterations.

2445 The enumerate() function attaches a counter variable to an iterable and returns it as the "enumerate" object.

2447 We can use this object directly in the "for" loops or transform it into a list of tuples by calling the list() function.

```
2449 enumerate(iterable, to_begin=0)
```

2450 Arguments:

2451 iterable: array type object which enables iteration

2452 to\_begin: the base index for the counter is to get started, its default value is 0

2453 # Example - enumerate function

```
2454 alist = ["apple","mango", "orange"]
```

```
2455 astr = "banana"
```

```
2457 # Let's set the enumerate objects
```

```
2458 list_obj = enumerate(alist)
```

```
2459 str_obj = enumerate(astr)
```

```
2461 print("list_obj type:", type(list_obj))
```

```
2462 print("str_obj type:", type(str_obj))
```

```
2464 print(list(enumerate(alist)) )
```

```
2465 # Move the starting index to two from zero
```

```
2466 print(list(enumerate(astr, 2)))
```

2467 The output is:

```
2469 list_obj type: <class 'enumerate'>
```

```
2470 str_obj type: <class 'enumerate'>
```

```
2471 [(0, 'apple'), (1, 'mango'), (2, 'orange')]
```

```
2472 [(2, 'b'), (3, 'a'), (4, 'n'), (5, 'a'), (6, 'n'), (7, 'a')]
```

2473 251. What Is The Use Of Globals() Function In Python?

2474 Ans: The globals() function in Python returns the current global symbol table as a dictionary object.

2476 Python maintains a symbol table to keep all necessary information about a program. This info is used to resolve the names of the variables and functions used in the program.

```
2477
2478 All the information in this table remains in the global scope of the program and Python allows
2479
2480 Signature: globals()
2481
2482 Arguments: None
2483 # Example: globals() function
2484 x = 9
2485 def fn():
2486     y = 3
2487     z = y + x
2488     # Calling the globals() method
2489     z = globals()['x'] = z
2490     return z
2491
2492 # Test Code
2493 ret = fn()
2494 print(ret)
2495 The output is:
2496
2497 12
2498 252. Why Do You Use The Zip() Method In Python?
2499 Ans: The zip method lets us map the corresponding index of multiple containers so that we can u
2500
2501 Signature:
2502     zip(*iterators)
2503 Arguments:
2504     Python iterables or collections (e.g., list, string, etc.)
2505 Returns:
2506     A single iterator object with combined mapped values
2507 # Example: zip() function
2508
2509 emp = [ "tom", "john", "jerry", "jake" ]
2510 age = [ 32, 28, 33, 44 ]
2511 dept = [ 'HR', 'Accounts', 'R&D', 'IT' ]
2512
2513 # call zip() to map values
2514 out = zip(emp, age, dept)
2515
2516 # convert all values for printing them as set
2517 out = set(out)
2518
2519 # Displaying the final values
2520 print ("The output of zip() is : ",end="")
2521 print (out)
2522 The output is:
2523
2524 The output of zip() is : {('jerry', 33, 'R&D'), ('jake', 44, 'IT'), ('john', 28, 'Accounts'), (
2525 253. What Are Class Or Static Variables In Python Programming?
2526 Ans: In Python, all the objects share common class or static variables.
2527
2528 But the instance or non-static variables are altogether different for different objects.
```

```
2529
2530 The programming languages like C++ and Java need to use the static keyword to make a variable a
2531
2532 All names initialized with a value in the class declaration becomes the class variables. And th
2533
2534 # Example
2535 class Test:
2536     aclass = 'programming' # A class variable
2537     def __init__(self, ainst):
2538         self.ainst = ainst # An instance variable
2539
2540 # Objects of CSStudent class
2541 test1 = Test(1)
2542 test2 = Test(2)
2543
2544 print(test1.aclass)
2545 print(test2.aclass)
2546 print(test1.ainst)
2547 print(test2.ainst)
2548
2549 # A class variable is also accessible using the class name
2550 print(Test.aclass)
2551 The output is:
2552
2553 programming
2554 programming
2555 1
2556 2
2557 programming
2558 Let's now answer some advanced-level Python interview questions.
2559
2560 254. How Does The Ternary Operator Work In Python?
2561 Ans: The ternary operator is an alternative for the conditional statements. It combines true or
2562
2563 The syntax would look like the one given below.
2564
2565 [onTrue] if [Condition] else [onFalse]
2566
2567 x, y = 35, 75
2568 smaller = x if x < y else y
2569 print(smaller)
2570 255. What Does The "Self" Keyword Do?
2571 Ans: The self is a Python keyword which represents a variable that holds the instance of an ob
2572
2573 In almost, all the object-oriented languages, it is passed to the methods as a hidden parameter
2574
2575 256. What Are The Different Methods To Copy An Object In Python?
2576 Ans: There are two ways to copy objects in Python.
2577
2578 copy.copy() function
2579 It makes a copy of the file from source to destination.
2580 It'll return a shallow copy of the parameter.
```

```
2581 copy.deepcopy() function
2582 It also produces the copy of an object from the source to destination.
2583 It'll return a deep copy of the parameter that you can pass to the function.
2584 257: What Is The Purpose Of Docstrings In Python?
2585 Ans: In Python, the docstring is what we call as the docstrings. It sets a process of recording
2586
2587 258. Which Python Function Will You Use To Convert A Number To A String?
2588 Ans: For converting a number into a string, you can use the built-in function str(). If you wa
2589
2590
2591
2592 259. How Do You Debug A Program In Python? Is It Possible To Step Through The Python Code?
2593 Ans: Yes, we can use the Python debugger (pdb) to debug any Python program. And if we start a p
2594
2595 260. List Down Some Of The PDB Commands For Debugging Python Programs?
2596 Ans: Here are a few PDB commands to start debugging Python code.
2597
2598 Add breakpoint (b)
2599 Resume execution (c)
2600 Step by step debugging (s)
2601 Move to the next line (n)
2602 List source code (l)
2603 Print an expression (p)
2604 261. What Is The Command To Debug A Python Program?
2605 Ans: The following command helps run a Python program in debug mode.
2606
2607 $ python -m pdb python-script.py
2608 262. How Do You Monitor The Code Flow Of A Program In Python?
2609 Ans: In Python, we can use the sys module's settrace() method to setup trace hooks and monitor
2610
2611 You need to define a trace callback method and pass it to the settrace() function. The callback
2612
2613 import sys
2614
2615 def trace_calls(frame, event, arg):
2616     # The 'call' event occurs before a function gets executed.
2617     if event != 'call':
2618         return
2619     # Next, inspect the frame data and print information.
2620     print 'Function name=%s, line num=%s' % (frame.f_code.co_name, frame.f_lineno)
2621     return
2622
2623 def demo2():
2624     print 'in demo2()'
2625
2626 def demo1():
2627     print 'in demo1()'
2628     demo2()
2629
2630 sys.settrace(trace_calls)
2631 demo1()
2632
```

```
2633
2634
2635
2636 263. How long can an identifier be in Python?
2637 Ans: According to the official Python documentation, an identifier can be of any length. However,
2638
2639 Apart from that, there are certain rules we must follow to name one:
2640
2641 According to the official Python documentation, an identifier can be of any length. However, P
2642
2643 Apart from that, there are certain rules we must follow to name one:
2644
2645 It can only begin with an underscore or a character from A-Z or a-z.
2646 The rest of it can contain anything from the following: A-Z/a-z/_/0-9.
2647 Python is case-sensitive, as we discussed in the previous question.
2648 Keywords cannot be used as identifiers. Python has the following keywords:
2649
2650
2651 and      def      False   import  not      True
2652 as       del      finally in       or       try
2653 assert  elif      for     is       pass    while
2654 break   else     from    lambda  print   with
2655 class   except   global None     raise   yield
2656 continue      exec    if       nonlocal      return
2657 264. How would you convert a string into lowercase?
2658 Ans: We use the lower() method for this.
2659
2660 >>> 'AyuShi'.lower()
2661 'ayushi'
2662
2663 To convert it into uppercase, then, we use upper().
2664
2665 >>> 'AyuShi'.upper()
2666 'AYUSHI'
2667
2668 Also, to check if a string is in all uppercase or all lowercase, we use the methods isupper() a
2669
2670 >>> 'AyuShi'.isupper()
2671 False
2672
2673 >>> 'AYUSHI'.isupper()
2674 True
2675
2676 >>> 'ayushi'.islower()
2677 True
2678
2679 >>> '@yu$hi'.islower()
2680 True
2681
2682 >>> '@YU$HI'.isupper()
2683 True
2684
```

```
2685 So, characters like @ and $ will suffice for both cases
2686
2687 Also, istitle() will tell us if a string is in title case.
2688
2689 >>> 'The Corpse Bride'.istitle()
2690 True
2691
2692
2693
2694 265. What is the pass statement in Python?
2695 There may be times in our code when we haven't decided what to do yet, but we must type something.
2696
2697 >>> def func(*args):
2698     pass
2699 >>>
2700 Similarly, the break statement breaks out of a loop.
2701
2702 >>> for i in range(7):
2703     if i==3: break
2704     print(i)
2705     1
2706
2707     2
2708
2709 Finally, the continue statement skips to the next iteration.
2710
2711 >>> for i in range(7):
2712     if i==3: continue
2713     print(i)
2714     1
2715
2716     2
2717
2718     4
2719
2720     5
2721
2722     6
2723
2724
2725
2726 266. Explain help() and dir() functions in Python?
2727 Ans:
2728
2729 The help() function displays the documentation string and help for its argument.
2730
2731 >>> import copy
2732 >>> help(copy.copy)
2733 Help on function copy in module copy:
2734
2735 copy(x)
2736
```

```
2737 Shallow copy operation on arbitrary Python objects.
2738
2739 See the module's __doc__ string for more info.
2740
2741 The dir() function displays all the members of an object(any kind).
2742
2743 >>> dir(copy.copy)
2744 ['__annotations__', '__call__', '__class__', '__closure__', '__code__', '__defaults__', '__delat
2745
2746
2747
2748 267. How do you get a list of all the keys in a dictionary?
2749 Ans:For this, we use the function keys().
2750
2751 >>> mydict={'a':1,'b':2,'c':3,'e':5}
2752 >>> mydict.keys()
2753 dict_keys(['a', 'b', 'c', 'e'])
2754
2755 268. How will you check if all characters in a string are alphanumeric?
2756 Ans: For this, we use the method isalnum().
2757
2758
2759
2760 269. With Python, how do you find out which directory you are currently in?
2761 Ans: To find this, we use the function/method getcwd(). We import it from the module os.
2762
2763 >>> import os
2764 >>> os.getcwd()
2765 'C:\\Users\\lifei\\AppData\\Local\\Programs\\Python\\Python36-32'
2766
2767 >>> type(os.getcwd)
2768 <class 'builtin_function_or_method'>
2769
2770 We can also change the current working directory with chdir().
2771
2772 >>> os.chdir('C:\\Users\\lifei\\Desktop')
2773 >>> os.getcwd()
2774 'C:\\Users\\lifei\\Desktop'
2775
2776
2777
2778 270. How do you insert an object at a given index in Python?
2779 Ans: Let's build a list first.
2780
2781 >>> a=[1,2,4]
2782 Now, we use the method insert. The first argument is the index at which to insert, the second i
2783
2784 >>> a.insert(2,3)
2785 >>> a
2786 [1, 2, 3, 4]
2787
2788
```

```
2789
2790 271. how do you reverse a list?
2791 Ans: Using the reverse() method.
2792
2793 >>> a.reverse()
2794 >>> a
2795 [4, 3, 2, 1]
2796
2797 You can also do it via slicing from right to left:
2798
2799 >>> a[::-1]
2800 >>> a
2801 [1, 2, 3, 4]
2802
2803 This gives us the original list because we already reversed it once. However, this does not mod
2804
2805
2806
2807 272. How does a function return values?
2808 Ans: A function uses the 'return' keyword to return a value. Take a look:
2809
2810 >>> def add(a,b):
2811     return a+b
2812
2813
2814 273. How would you define a block in Python?
2815 Ans: For any kind of statements, we possibly need to define a block of code under them. Howeve
2816
2817 >>> if 3>1:
2818     print("Hello")
2819     print("Goodbye")
2820 Hello
2821
2822 Goodbye
2823
2824
2825
2826
2827
2828 274. Will the do-while loop work if you don't end it with a semicolon?
2829 Ans: Trick question! Python does not support an intrinsic do-while loop. Secondly, to terminate
2830
2831
2832
2833 275. In one line, show us how you'll get the max alphabetical character from a string.?
2834 Ans: For this, we'll simply use the max function.
2835
2836 >>> max('flyiNg')
2837 'y'
2838
2839 The following are the ASCII values for all the letters of this string-
2840
```

```
2841 f- 102
2842
2843 l- 108
2844
2845 y- 121
2846
2847 i- 105
2848
2849 N- 78
2850
2851 g- 103
2852
2853 By this logic, try to explain the following line of code-
2854
2855 >>> max('fly{}iNg')
2856 '}'
2857
2858 (Bonus: } - 125)
2859
2860
2861
2862 276. What is Python good for?
2863 Ans: Python is a jack of many trades, check out Applications of Python to find out more.
2864
2865 Meanwhile, we'll say we can use it for:
2866
2867 Web and Internet Development
2868 Desktop GUI
2869 Scientific and Numeric Applications
2870 Software Development Applications
2871 Applications in Education
2872 Applications in Business
2873 Database Access
2874 Network Programming
2875 Games, 3D Graphics
2876 Other Python Applications
2877
2878
2879 277. Can you name ten built-in functions in Python and explain each in brief?
2880 Ans: Ten Built-in Functions, you say? Okay, here you go.
2881
2882 complex()- Creates a complex number.
2883
2884 >>> complex(3.5,4)
2885 (3.5+4j)
2886
2887 eval()- Parses a string as an expression.
2888
2889 >>> eval('print(max(22,22.0)-min(2,3))')
2890 20
2891
2892 filter()- Filters in items for which the condition is true.
```

```
2893
2894 >>> list(filter(lambda x:x%2==0,[1,2,0,False]))
2895 [2, 0, False]
2896
2897 format()- Lets us format a string.
2898
2899 >>> print("a={0} but b={1}".format(a,b))
2900 a=2 but b=3
2901
2902 hash()- Returns the hash value of an object.
2903
2904 >>> hash(3.7)
2905 644245917
2906
2907 hex()- Converts an integer to a hexadecimal.
2908
2909 >>> hex(14)
2910 '0xe'
2911
2912 input()- Reads and returns a line of string.
2913
2914 >>> input('Enter a number')
2915 Enter a number7
2916
2917 '7'
2918 len()- Returns the length of an object.
2919
2920 >>> len('Ayushi')
2921 6
2922
2923 locals()- Returns a dictionary of the current local symbol table.
2924
2925 >>> locals()
2926 {'__name__': '__main__', '__doc__': None, '__package__': None, '__loader__': <class '_frozen_in
2927
2928 open()- Opens a file.
2929
2930 >>> file=open('tabs.txt')
2931
2932
2933 278. How will you convert a list into a string?
2934 Ans: We will use the join() method for this.
2935
2936 >>> nums=['one','two','three','four','five','six','seven']
2937 >>> s=' '.join(nums)
2938 >>> s
2939 o/p= 'one two three four five six seven'
2940
2941
2942
2943 279. How will you remove a duplicate element from a list?
2944 Ans: We can turn it into a set to do that.
```

```
2945
2946 >>> list=[1,2,1,3,4,2]
2947 >>> set(list)
2948 {1, 2, 3, 4}
2949
2950
2951
2952 280. Can you explain the life cycle of a thread?
2953 Ans:
2954
2955 python scripting interview questions
2956
2957 To create a thread, we create a class that we make override the run method of the thread class
2958 A thread that we just created is in the new state. When we make a call to start() on it, it for
2959 When execution begins, the thread is in the running state.
2960 Calls to methods like sleep() and join() make a thread wait. Such a thread is in the waiting/b
2961 When a thread is done waiting or executing, other waiting threads are sent for scheduling.
2962 A running thread that is done executing terminates and is in the dead state.
2963
2964
2965 281. Explain the //, %, and ** operators in Python?
2966 Ans: The // operator performs floor division. It will return the integer part of the result on
2967
2968 >>> 7//2
2969 3
2970
2971 Normal division would return 3.5 here.
2972
2973 Similarly, ** performs exponentiation. a**b returns the value of a raised to the power b.
2974
2975 >>> 2**10
2976 1024
2977
2978 Finally, % is for modulus. This gives us the value left after the highest achievable division.
2979
2980 >>> 13%7
2981 6
2982
2983 >>> 3.5%1.5
2984 0.5
2985
2986
2987
2988 282. What are membership operators?
2989 Ans: With the operators 'in' and 'not in', we can confirm if a value is a member in another.
2990
2991 >>> 'me' in 'disappointment'
2992 True
2993
2994 >>> 'us' not in 'disappointment'
2995 True
2996
```

```
2997
2998
2999 283. Explain identity operators in Python?
3000 Ans: The operators 'is' and 'is not' tell us if two values have the same identity.
3001
3002 >>> 10 is '10'
3003 False
3004
3005 >>> True is not False
3006 True
3007
3008
3009
3010 284. Finally, tell us about bitwise operators in Python?
3011
3012 Ans:
3013
3014 python interview questions for freshers
3015
3016 These operate on values bit by bit.
3017
3018 AND (&) This performs & on each bit pair.
3019
3020 >>> 0b110 & 0b010
3021 2
3022
3023 OR (|) This performs | on each bit pair.
3024
3025 >>> 3|2
3026 3
3027
3028 XOR (^) This performs an exclusive-OR operation on each bit pair.
3029
3030 >>> 3^2
3031 1
3032
3033 Binary One's Complement (~) This returns the one's complement of a value.
3034
3035 >>> ~2
3036 -3
3037
3038 Binary Left-Shift (<<) This shifts the bits to the left by the specified amount.
3039
3040 >>> 1<<2
3041 4
3042
3043 Here, 001 was shifted to the left by two places to get 100, which is binary for 4.
3044
3045 Binary Right-Shift (>>)
3046
3047 >>> 4>>2
3048 1
```

```
3049
3050
3051
3052 285. What data types does Python support?
3053 Ans: Python provides us with five kinds of data types:
3054
3055 Numbers - Numbers use to hold numerical values.
3056
3057 >>> a=7.0
3058 >>>
3059 Strings - A string is a sequence of characters. We declare it using single or double quotes.
3060
3061 >>> title="Ayushi's Book"
3062 Lists - A list is an ordered collection of values, and we declare it using square brackets.
3063
3064 >>> colors=['red','green','blue']
3065 >>> type(colors)
3066 <class 'list'>
3067
3068 Tuples - A tuple, like a list, is an ordered collection of values. The difference. However, is
3069
3070 >>> name=('Ayushi','Sharma')
3071 >>> name[0]='Avery'
3072 Traceback (most recent call last):
3073
3074 File "<pyshell#129>", line 1, in <module>
3075
3076 name[0]='Avery'
3077
3078 TypeError: 'tuple' object does not support item assignment
3079
3080 Dictionary - A dictionary is a data structure that holds key-value pairs. We declare it using curly braces.
3081
3082 >>> squares={1:1,2:4,3:9,4:16,5:25}
3083 >>> type(squares)
3084 <class 'dict'>
3085
3086 >>> type({})
3087 <class 'dict'>
3088
3089 We can also use a dictionary comprehension:
3090
3091 >>> squares={x:x**2 for x in range(1,6)}
3092 >>> squares
3093 {1: 1, 2: 4, 3: 9, 4: 16, 5: 25}
3094
3095
3096
3097 286. How would you convert a string into an int in Python?
3098 Ans: If a string contains only numerical characters, you can convert it into an integer using the int() function.
3099
3100 >>> int('227')
```

```
3101 227
3102
3103 Let's check the types:
3104
3105 >>> type('227')
3106 <class 'str'>
3107
3108 >>> type(int('227'))
3109 <class 'int'>
3110
3111
3112
3113 287. How do you take input in Python?
3114 Ans: For taking input from the user, we have the function input(). In Python 2, we had another
3115
3116 The input() function takes, as an argument, the text to be displayed for the task:
3117
3118 >>> a=input('Enter a number')
3119 Enter a number7
3120
3121 But if you have paid attention, you know that it takes input in the form of a string.
3122
3123 >>> type(a)
3124 <class 'str'>
3125
3126 Multiplying this by 2 gives us this:
3127
3128 >>> a*=2
3129 >>> a
3130 '77'
3131
3132 So, what if we need to work on an integer instead?
3133
3134 We use the int() function for this.
3135
3136 >>> a=int(input('Enter a number'))
3137 Enter a number7
3138
3139 Now when we multiply it by 2, we get this:
3140
3141 >>> a*=2
3142 >>> a
3143 14
3144
3145
3146
3147 288. What is a function?
3148 Ans: When we want to execute a sequence of statements, we can give it a name. Let's define a fu
3149
3150 >>> def greater(a,b):
3151     return a is a>b else b
3152 >>> greater(3,3.5)
```

```
3153 3.5
3154
3155
3156
3157
3158
3159 289. What is recursion?
3160 Ans: When a function makes a call to itself, it is termed recursion. But then, in order for it
3161
3162 Let's take an example.
3163
3164 >>> def facto(n):
3165     if n==1: return 1
3166     return n*facto(n-1)
3167 >>> facto(4)
3168 24
3169
3170
3171
3172
3173
3174 290. What do you know about relational operators in Python?
3175 Ans:
3176
3177 Top python interview questions with answers
3178
3179
3180
3181 Relational operators compare values.
3182
3183 Less than (<) If the value on the left is lesser, it returns True.
3184
3185 >>> 'hi'<'Hi'
3186 False
3187 Greater than (>) If the value on the left is greater, it returns True.
3188
3189 >>> 1.1+2.2>3.3
3190 True
3191
3192 This is because of the flawed floating-point arithmetic in Python, due to hardware dependencies
3193
3194 Less than or equal to (<=) If the value on the left is lesser than or equal to, it returns True
3195
3196 >>> 3.0<=3
3197 True
3198
3199 Greater than or equal to (>=) If the value on the left is greater than or equal to, it returns
3200
3201 >>> True>=False
3202 True
3203
3204 Equal to (==) If the two values are equal, it returns True.
```

```
3205
3206 >>> {1,3,2,2}=={1,2,3}
3207 True
3208
3209 Not equal to (!=) If the two values are unequal, it returns True.
3210
3211 >>> True!=0.1
3212 True
3213
3214 >>> False!=0.1
3215 True
3216
3217
3218
3219 291. What are assignment operators in Python?
3220 Ans:
3221
3222
3223
3224 python coding interview questions
3225
3226 We can combine all arithmetic operators with the assignment symbol.
3227
3228 >>> a=7
3229 >>> a+=1
3230 >>> a
3231 8
3232
3233 >>> a-=1
3234 >>> a
3235 7
3236
3237 >>> a*=2
3238 >>> a
3239 14
3240
3241 >>> a/=2
3242 >>> a
3243 7.0
3244
3245 >>> a**=2
3246 >>> a
3247 49.0
3248
3249 >>> a//=3
3250 >>> a
3251 16.0
3252
3253 >>> a%=4
3254 >>> a
3255 0.0
3256
```

```
3257
3258
3259
3260
3261 292. Explain logical operators in Python.?
3262 Ans: We have three logical operators- and, or, not.
3263
3264 >>> False and True
3265 False
3266
3267 >>> 7<7 or True
3268 True
3269
3270 >>> not 2==2
3271 False
3272
3273
3274
3275
3276
3277 293. What does the function zip() do?
3278 Ans: One of the less common functions with beginners, zip() returns an iterator of tuples.
3279
3280 >>> list(zip(['a','b','c'],[1,2,3]))
3281 [('a', 1), ('b', 2), ('c', 3)]
3282
3283 Here, it pairs items from the two lists and creates tuples with those. But it doesn't have to be
3284
3285 >>> list(zip(('a','b','c'),(1,2,3)))
3286 [('a', 1), ('b', 2), ('c', 3)]
3287
3288
3289
3290 294. How can you declare multiple assignments in one statement?
3291 Ans: There are two ways to do this:
3292
3293 First -
3294
3295 >>> a,b,c=3,4,5 #This assigns 3, 4, and 5 to a, b, and c respectively
3296 Second -
3297
3298 >>> a=b=c=3 #This assigns 3 to a, b, and c
3299
3300
3301
3302
3303 295. If you are ever stuck in an infinite loop, how will you break out of it?
3304 Ans: For this, we press Ctrl+C. This interrupts the execution. Let's create an infinite loop to
3305
3306 >>> def counterfunc(n):
3307 while(n==7):print(n)
3308 >>> counterfunc(7)
```

3360 Ans: While both files hold bytecode, .pyc is the compiled version of a Python file. It has plat

```
3361
3362
3363
3364 297. How many types of objects does Python support?
3365 Ans: Immutable objects- Those which do not let us modify their contents. Examples of these will
3366
3367 >>> tuple=(1,2,4)
3368 >>> tuple
3369 (1, 2, 4)
3370
3371 >>> 2+4j
3372 (2+4j)
3373
3374 Mutable objects - Those that let you modify their contents. Examples of these are lists, sets,
3375
3376 >>> [2,4,9]
3377 [2, 4, 9]
3378
3379 >>> dict1={1:1,2:2}
3380 >>> dict1
3381 {1: 1, 2: 2}
3382
3383 While two equal immutable objects' reference variables share the same address, it is possible t
3384
3385
3386
3387 298. When is the else part of a try-except block executed?
3388 Ans: In an if-else block, the else part is executed when the condition in the if-statement is f
3389
3390
3391
3392
3393
3394 299. Explain join() and split() in Python?
3395 Ans:
3396
3397 1)join() lets us join characters from a string together by a character we specify.
3398
3399 >>> ','.join('12345')
3400 '1,2,3,4,5'
3401
3402 2) split() lets us split a string around the character we specify.
3403
3404 >>> '1,2,3,4,5'.split(',')
3405 ['1', '2', '3', '4', '5']
3406
3407
3408
3409 300. Explain a few methods to implement Functionally Oriented Programming in Python?
3410 Ans:
3411
3412 Sometimes, when we want to iterate over a list, a few methods come in handy.
```

```
3413
3414 a. filter()
3415
3416 Filter lets us filter in some values based on conditional logic.
3417
3418 >>> list(filter(lambda x:x>5,range(8)))
3419 [6, 7]
3420
3421 b. map()
3422
3423 Map applies a function to every element in an iterable.
3424
3425 >>> list(map(lambda x:x**2,range(8)))
3426 [0, 1, 4, 9, 16, 25, 36, 49]
3427 c. reduce()
3428
3429 Reduce repeatedly reduces a sequence pair-wise until we reach a single value.
3430
3431 >>> from functools import reduce
3432 >>> reduce(lambda x,y:x-y,[1,2,3,4,5])
3433 -13
3434
3435 300. Explain a few methods to implement Functionally Oriented Programming in Python?
3436 Ans:
3437
3438 Sometimes, when we want to iterate over a list, a few methods come in handy.
3439
3440 a. filter()
3441
3442 Filter lets us filter in some values based on conditional logic.
3443
3444 >>> list(filter(lambda x:x>5,range(8)))
3445 [6, 7]
3446
3447 b. map()
3448
3449 Map applies a function to every element in an iterable.
3450
3451 >>> list(map(lambda x:x**2,range(8)))
3452 [0, 1, 4, 9, 16, 25, 36, 49]
3453 c. reduce()
3454
3455 Reduce repeatedly reduces a sequence pair-wise until we reach a single value.
3456
3457 >>> from functools import reduce
3458 >>> reduce(lambda x,y:x-y,[1,2,3,4,5])
3459 -13
3460
3461
3462
3463 301. Is del the same as remove()? What are they?
3464 Ans:
```

```
3465
3466 del and remove() are methods on lists/ ways to eliminate elements.
3467
3468 >>> list=[3,4,5,6,7]
3469 >>> del list[3]
3470 >>> list
3471 [3, 4, 5, 7]
3472
3473 >>> list.remove(5)
3474 >>> list
3475 [3, 4, 7]
3476
3477 While del lets us delete an element at a certain index, remove() lets us remove an element by value.
3478
3479
3480
3481 302. Explain a few methods to implement Functionally Oriented Programming in Python?
3482 Ans: Sometimes, when we want to iterate over a list, a few methods come in handy.
3483
3484 a. filter()
3485
3486 Filter lets us filter in some values based on conditional logic.
3487
3488 >>> list(filter(lambda x:x>5,range(8)))
3489 [6, 7]
3490
3491 b. map()
3492
3493 Map applies a function to every element in an iterable.
3494
3495 >>> list(map(lambda x:x**2,range(8)))
3496 [0, 1, 4, 9, 16, 25, 36, 49]
3497 c. reduce()
3498
3499 Reduce repeatedly reduces a sequence pair-wise until we reach a single value.
3500
3501 >>> from functools import reduce
3502 >>> reduce(lambda x,y:x-y,[1,2,3,4,5])
3503 -13
3504
3505
3506
3507 304. How do you open a file for writing?
3508 Ans: Let's create a text file on our Desktop and call it tabs.txt. To open it to be able to write to it.
3509
3510 >>> file=open('tabs.txt','w')
3511 This opens the file in writing mode. You should close it once you're done.
3512
3513 >>> file.close()
3514
3515
3516
```

```
3517
3518 305. Difference between the append() and extend() methods of a list.
3519 Ans: The methods append() and extend() work on lists. While append() adds an element to the end
3520
3521 Let's take two lists.
3522
3523 >>> list1,list2=[1,2,3],[5,6,7,8]
3524 This is how append() works:
3525
3526 >>> list1.append(4)
3527 >>> list1
3528 [1, 2, 3, 4]
3529
3530 And this is how extend() works:
3531
3532 >>> list1.extend(list2)
3533 >>> list1
3534 [1, 2, 3, 4, 5, 6, 7, 8]
3535
3536
3537
3538 306. What are the different file-processing modes with Python?
3539 We have the following modes-
3540
3541 read-only - 'r'
3542 write-only - 'w'
3543 read-write - 'rw'
3544 append - 'a'
3545 We can open a text file with the option 't'. So to open a text file to read it, we can use the
3546
3547
3548
3549
3550
3551 307. What does the map() function do?
3552 Ans: map() executes the function we pass to it as the first argument; it does so on all element
3553
3554 >>> for i in map(lambda i:i**3, (2,3,7)):
3555     print(i)
3556 8
3557 27
3558 343
3559
3560 This gives us the cubes of the values 2, 3, and 7.
3561
3562
3563
3564
3565
3566 308. Is there a way to remove the last object from a list?
3567 Yes, there is. Try running the following piece of code-
3568
```

```
3569 >>> list=[1,2,3,4,5
```

```
3570 >>> list.pop(-1)
```

```
3571 5
```

```
3572
```

```
3573 >>> list
```

```
3574 [1, 2, 3, 4]
```

```
3575
```

```
3576
```

```
3577
```

```
3578
```

```
3579
```

```
3580
```

```
3581
```

```
3582 309. How will you convert an integer to a Unicode character?
```

```
3583 Ans: This is simple. All we need is the chr(x) built-in function. See how.
```

```
3584
```

```
3585 >>> chr(52)
```

```
3586 '4'
```

```
3587
```

```
3588 >>> chr(49)
```

```
3589 '1'
```

```
3590
```

```
3591 >>> chr(67)
```

```
3592 'C'
```

```
3593
```

```
3594
```

```
3595
```

```
3596
```

```
3597
```

```
3598 310. So does recursion cause any trouble?
```

```
3599 Ans: Sure does:
```

```
3600
```

```
3601 Needs more function calls.
```

```
3602 Each function call stores a state variable to the program stack- consumes memory, can cause mem
```

```
3603 Calling a function consumes time.
```

```
3604
```

```
3605
```

```
3606
```

```
3607
```

```
3608
```

```
3609
```

```
3610 311. What good is recursion?
```

```
3611 Ans: With recursion, we observe the following:
```

```
3612
```

```
3613 Need to put in less efforts.
```

```
3614 Smaller code than that by loops.
```

```
3615 Easier-to-understand code.
```

```
3616
```

```
3617
```

```
3618
```

```
3619
```

```
3620
```

```
3621
3622
3623
3624
3625
3626 312. Can you remove the whitespaces from the string "aaa bbb ccc ddd eee"?
3627 Ans: I can think of three ways to do this.
3628
3629 Using join-
3630
3631 >>> s='aaa bbb ccc ddd eee'
3632 >>> s1="".join(s.split())
3633 >>> s1
3634 'aaabbbcccddeee'
3635
3636 Using a list comprehension-
3637
3638 >>> s='aaa bbb ccc ddd eee'
3639 >>> s1=str("".join([i for i in s if i!=' ']))
3640 >>> s1
3641 'aaabbbcccddeee'
3642
3643 Using replace()-
3644
3645 >>> s='aaa bbb ccc ddd eee'
3646 >>> s1 = s.replace(' ','')
3647 >>> s1
3648 'aaabbbcccddeee'
3649
3650
3651
3652
3653
3654
3655
3656 313. How do you get the current working directory using Python?
3657 Ans: Working on software with Python, you may need to read and write files from various directories.
3658
3659 >>> import os
3660 >>> os.getcwd()
3661 'C:\\Users\\Raj\\AppData\\Local\\Programs\\Python\\Python37-32'
3662
3663
3664
3665 314. What are the file-related modules we have in Python?
3666 Ans: We have the following libraries and modules that let us manipulate text and binary files or directories.
3667
3668 os
3669 os.path
3670 shutil
3671
3672
```

```
3673
3674
3675
3676
3677
3678 315. Explain the uses of the modules sqlite3, ctypes, pickle, traceback, and itertools.
3679 sqlite3- Helps with handling databases of type SQLite
3680 ctypes- Lets create and manipulate C data types in Python
3681 pickle- Lets put any data structure to external files
3682 traceback- Allows extraction, formatting, and printing of stack traces
3683 itertools- Supports working with permutations, combinations, and other useful iterables.
3684
3685
3686
3687
3688
3689
3690 316. How will you print the contents of a file?
3691 >>> try:
3692 with open('tabs.txt','r') as f:
3693 print(f.read())
3694 except IOError:
3695 print("File not found")
3696
3697
3698
3699
3700
3701
3702 317. What is Virtualenv in Python?
3703 Ans: virtualenv is a tool to create isolated Python environments. virtualenv creates a folder v
3704
3705 Install virtualenv via pip: $ pip install virtualenv.
3706
3707
3708
3709
3710
3711 318. What is the function of "self"?
3712 Ans: Self is a variable that represents the instance of the object to itself. In most of the ob
3713
3714 Let's say you have a class ClassA which contains a method methodA defined as:
3715
3716 def methodA(self, arg1, arg2): #do something
3717 and ObjectA is an instance of this class.
3718
3719 Now when ObjectA.methodA(arg1, arg2) is called, python internally converts it for you as:
3720
3721 ClassA.methodA(ObjectA, arg1, arg2)
3722 The self variable refers to the object itself.
3723
3724
```

319. What does the Python nonlocal statement do (in Python 3.0 and later)?

Ans: In short, it lets you assign values to a variable in an outer (but non-global) scope.

The nonlocal statement causes the listed identifiers to refer to previously bound variables in

For example the counter generator can be rewritten to use this so that it looks more like the f

```
def make_counter():
```

```
    count = 0
```

```
    def counter():
```

```
        nonlocal count
```

```
        count += 1
```

```
        return count
```

```
    return counter
```

320. What are the wheels and eggs? What is the difference?

Ans:

Wheel and Egg are both packaging formats that aim to support the use case of needing an install

The Egg format was introduced by setuptools in 2004, whereas the Wheel format was introduced by

Wheel is currently considered the standard for built and binary packaging for Python.

Here's a breakdown of the important differences between Wheel and Egg.

Wheel has an official PEP. Egg did not.

Wheel is a distribution format, i.e a packaging format. 1 Egg was both a distribution format and

Wheel archives do not include .pyc files. Therefore, when the distribution only contains Python

Wheel uses PEP376-compliant .dist-info directories. Egg used .egg-info.

Wheel has a richer file naming convention. A single wheel archive can indicate its compatibility

Wheel is versioned. Every wheel file contains the version of the wheel specification and the in

Wheel is internally organized by sysconfig path type, therefore making it easier to convert to

321. What is webpack?

Ans: Webpack is a build tool that puts all of your assets, including Javascript, images, fonts,

322. Name some benefits of using webpack

Ans: Webpack and static assets in a dependency graph offers many benefits. Here's a few:

Dead asset elimination. This is killer, especially for CSS rules. You only build the images and  
Easier code splitting. For example, because you know that your file Homepage.js only requires s  
You control how assets are processed. If an image is below a certain size, you could base64 enc  
Stable production deploys. You can't accidentally deploy code with images missing, or outdated  
Webpack will slow you down at the start, but give you great speed benefits when used correctly  
Webpack is the main build tool adopted by the React community.

323. Name some plugins you think are very important and helpful?

Ans:

CommonsChunkPlugin - creates a separate file (known as a chunk), consisting of common modules s  
DefinePlugin - allows you to create global constants which can be configured at compile time.  
HtmlWebpackPlugin - simplifies creation of HTML files to serve your webpack bundles.  
ExtractTextWebpackPlugin - Extract text from a bundle, or bundles, into a separate file.  
CompressionWebpackPlugin - Prepare compressed versions of assets to serve them with Content-Enc

324. Webpack gives us a dependency graph. What does that mean?

Ans: Any time one file depends on another, webpack treats this as a dependency. This allows we

Webpack lets you use require() on local "static assets":

```
<img src={ require('../assets/logo.png') } />
```

When webpack processes your application, it starts from a list of modules defined on the commar

The require('logo.png') source code never actually gets executed in the browser (nor in Node.js)

325. What are metaclasses in Python?

Ans: A metaclass is the class of a class. A class defines how an instance of the class (i.e. an

3829
3830
3831
3832 326. How to make a chain of function decorators?
3833 Ans: How can I make two decorators in Python that would do the following?
3834
3835 @makebold
3836 @makeitalic
3837 def say():
3838     return "Hello"
3839 which should return:
3840
3841 "<b><i>Hello</i></b>"
3842 Answer:
3843 Consider:
3844
3845 from functools import wraps
3846
3847 def makebold(fn):
3848     @wraps(fn)
3849     def wrapped(*args, **kwargs):
3850         return "<b>" + fn(*args, **kwargs) + "</b>"
3851     return wrapped
3852
3853 def makeitalic(fn):
3854     @wraps(fn)
3855     def wrapped(*args, **kwargs):
3856         return "<i>" + fn(*args, **kwargs) + "</i>"
3857     return wrapped
3858
3859 @makebold
3860 @makeitalic
3861 def hello():
3862     return "hello world"
3863
3864 @makebold
3865 @makeitalic
3866 def log(s):
3867     return s
3868
3869 print hello()          # returns "<b><i>hello world</i></b>"
3870 print hello.__name__  # with functools.wraps() this returns "hello"
3871 print log('hello')    # returns "<b><i>hello</i></b>"
3872
3873
3874
3875
3876
3877
3878
3879 327. What is the difference between @staticmethod and @classmethod?
3880 Ans: A staticmethod is a method that knows nothing about the class or instance it was called on
```

```
3881
3882 class C:
3883     @staticmethod
3884     def f(arg1, arg2, ...): ...
3885 A classmethod, on the other hand, is a method that gets passed the class it was called on, or t
3886
3887 class C:
3888     @classmethod
3889     def f(cls, arg1, arg2, ...): ...
3890 If your method accesses other variables/methods in your class then use @classmethod.
3891
3892
3893
3894 328. What's the difference between a Python module and a Python package?
3895 Ans: Any Python file is a module, its name being the file's base name without the .py extension
3896
3897 import my_module
3898 A package is a collection of Python modules: while a module is a single Python file, a package
3899
3900 Packages are modules too. They are just packaged up differently; they are formed by the combin

3983

3984 335. What is MRO in Python? How does it work?

Ans: Method Resolution Order (MRO) it denotes the way a programming language resolves a method  
In Python,\*\* method resolution order\*\* defines the order in which the base classes are searched  
Python resolves method and attribute lookups using the C3 linearisation of the class and its pa

336. What is the difference between old style and new style classes in Python?

Ans: Declaration-wise:

New-style classes inherit from object, or from another new-style class.

```
class NewStyleClass(object):
```

```
    pass
```

```
class AnotherNewStyleClass(NewStyleClass):
```

```
    pass
```

Old-style classes don't.

```
class OldStyleClass():
```

```
    pass
```

Python 3 Note:

Python 3 doesn't support old style classes, so either form noted above results in a new-style c

Also, MRO (Method Resolution Order) changed:

Classic classes do a depth first search from left to right. Stop on first match. They do not ha  
New-style classes MRO is more complicated to synthesize in a single English sentence. One of it  
Some other notes:

New style class objects cannot be raised unless derived from Exception.

Old style classes are still marginally faster for attribute lookup.

337. Why Python (CPython and others) uses the GIL?

Ans: In CPython, the global interpreter lock, or GIL, is a mutex that prevents multiple native

Python has a GIL as opposed to fine-grained locking for several reasons:

It is faster in the single-threaded case.

It is faster in the multi-threaded case for i/o bound programs.

It is faster in the multi-threaded case for cpu-bound programs that do their compute-intensive

It makes C extensions easier to write: there will be no switch of Python threads except where y

It makes wrapping C libraries easier. You don't have to worry about thread-safety. If the libra

338. How are arguments passed by value or by reference in python?

Ans:

Pass by value: Copy of the actual object is passed. Changing the value of the copy of the objec

Pass by reference: Reference to the actual object is passed. Changing the value of the new obje

In Python, arguments are passed by reference, i.e., reference to the actual object is passed.

```
def appendNumber(arr):
```

```
    arr.append(4)
```

```
arr = [1, 2, 3]
```

```
print(arr) #Output: => [1, 2, 3]
```

```
appendNumber(arr)
```

```
print(arr) #Output: => [1, 2, 3, 4]
```

339. What is a boolean in Python?

Ans: Boolean is one of the built-in data types in Python, it mainly contains two values, and th

Python bool() is the method used to convert a value to a boolean value.

1

Syntax for bool() method: bool([a])

340. What is Python String format and Python String replace?

Ans: Python String Format: The String format() method in Python is mainly used to format the g

Syntax for String format() method:

1

```
template.format(p0, p1, ..., k0=v0, k1=v1, ...)
```

Python String Replace: This method is mainly used to return a copy of the string in which all t

4101
4102
4103
4104 341. Name some of the built-in modules in Python?
4105 Ans: The built-in modules in Python are:
4106
4107 sys module
4108 OS module
4109 random module
4110 collection module
4111 JSON
4112 Math module
4113
4114
4115
4116
4117
4118
4119
4120
4121 342. How do we convert the string to lowercase?
4122 Ans: lower() function is used to convert string to lowercase.
4123
4124 Example:
4125
4126 1
4127 2
4128 str = 'XYZ'
4129 print(str.lower())
4130 Output:
4131 1
4132 xyz

4170 344. What is Try Block?
4171 A block which is preceded by the try keyword is known as a try block
4172
4173 Syntax:
4174
4175 1
4176 2
4177 3
4178 try{
4179     //statements that may cause an exception
4180 }
4181
4182
4183
4184
4185
4186
4187
4188
4189 345. How can we access a module written in Python from C?
4190 Ans: We can access the module written in Python from C by using the following method.
4191
4192 1
```

```
4193 Module == PyImport_ImportModule("<modulename>");
4194
4195
4196
4197
4198
4199
4200 346. Write a program to count the number of capital letters in a file?
4201 Ans:
4202 1
4203 2
4204 3
4205 4
4206 5
4207 6
4208 with open(SOME_LARGE_FILE) as countletter:
4209     count = 0
4210     text = countletter.read()
4211     for character in text:
4212         if character.isupper():
4213             count += 1
4214
4215
4216
4217
4218
4219
4220
4221
4222 347. Write a program to display the Fibonacci sequence in Python?
4223 Ans:
4224 1
4225 2
4226 3
4227 4
4228 5
4229 6
4230 7
4231 8
4232 9
4233 10
4234 11
4235 12
4236 13
4237 14
4238 15
4239 16
4240 17
4241 18
4242 19
4243 20
4244 21
```

```
4245 # Displaying Fibonacci sequence
4246 n = 10
4247 # first two terms
4248 n0 = 0
4249 n1 = 1
4250 #Count
4251 x = 0
4252 # check if the number of terms is valid
4253 if n <= 0:
4254     print("Enter positive integer")
4255 elif n == 1:
4256     print("Numbers in Fibonacci sequence upto",n,":")
4257     print(n0)
4258 else:
4259     print("Numbers in Fibonacci sequence upto",n,":")
4260     while x < n:
4261         print(n0,end=', ')
4262         nth = n0 + n1
4263         n0 = n1
4264         n1 = nth
4265         x += 1
4266 Output:
4267
4268 1
4269 0, 1, 1, 2, 3, 5, 8, 13, 21, 34,
4270

4272
4273
4274
4275
4276 348. Write a program in Python to produce Star triangle?
4277 Ans: The code to produce star triangle is as follows:
4278
4279 1
4280 2
4281 3
4282 4
4283 def pyfun(r):
4284     for a in range(r):
4285         print(' '*(r-x-1)+'*'(2*x+1))
4286     pyfun(9)
4287 Output:
4288
4289 1
4290 2
4291 3
4292 4
4293 5
4294 6
4295 7
4296 8
```

4309
4310
4311 349. Write a program to check whether the given number is prime or not?
4312 Ans: The code to check prime number is as follows:
4313
4314 1
4315 2
4316 3
4317 4
4318 5
4319 6
4320 7
4321 8
4322 9
4323 10
4324 11
4325 12
4326 13
4327 14
4328 15
4329 16
4330 17
4331 # program to check the number is prime or not
4332 n1 = 409
4333 # num1 = int(input("Enter any one number: "))
4334 # prime number is greater than 1
4335 if n1 > 1:
4336     # check the following factors
4337     for x in range(2,num1):
4338         if (n1 % x) == 0:
4339             print(n1,"is not a prime number")
4340             print(x,"times",n1//x,"is",num)
4341             break
4342         else:
4343             print(n1,"is a prime number")
4344     # if input number is smaller than
4345     # or equal to the value 1, then it is not prime number
4346     else:
4347         print(n1,"is not a prime number")
4348 Output:
```

```
4349
4350 1
4351 409 is a prime number
4352
4353
4354
4355
4356
4357
4358
4359
4360 350. Write Python code to check the given sequence is a palindrome or not?
4361 Ans:
4362
4363 1
4364 2
4365 3
4366 4
4367 5
4368 6
4369 7
4370 8
4371 9
4372 10
4373 11
4374 # Python code to check a given sequence
4375 # is palindrome or not
4376 my_string1 = 'MOM'
4377 My_string1 = my_string1.casefold()

4379 rev_string1 = reversed(my_string1)
4380 # check whether the string is equal to the reverse of it or not
4381 if list(my_string1) == list(rev_string1):
4382     print("It is a palindrome")
4383 else:
4384     print("It is not a palindrome")
4385 Output:
4386
4387 1
4388 it is a palindrome
4389
4390
4391
4392
4393
4394
4395
4396
4397 351. Write Python code to sort a numerical dataset?
4398 Ans: The code to sort a numerical dataset is as follows:
4399
4400 1
```

```
4401 2
4402 3
4403 4
4404 list = [ "13", "16", "1", "5" , "8"]
4405 list = [int(x) for x in the list]
4406 list.sort()
4407 print(list)
4408 Output:
4409
4410 1
4411 1, 5, 8, 13, 16
4412
4413
4414
4415
```
